NCT6683D-LU

Nuvoton eSIO

HARDWARE DATASHEET
(External Architecture)

Date: May 14, 2013 Revision 0.7

TABLE OF CONTENTS –

1. GENERAL DESCRIPTION

NCT6683D-LU is a high performance 8 bit microcontrollers to execute MCS51 instruction set. A rich set of features and peripherals enable to match many specific applications, for example, PC mother board Super IO, Notebook/Netbook EC controller or consumer health monitor embedded controller.

The microcontroller includes memory pointer, interrupts, interfaces for serial communication, I2C and SPI interfaces, a timer system, I/O ports, power management unit, multiplication-division unit, watchdog timer and DMA controller. Integrated on-chip debugger is also available.

NCT6683D-LU provides flexible I/O control functions through a set of general purpose I/O (GPIO) ports. These GPIO port may serve as simple I/O ports or may be individually configured to provide alternative functions. The GPIO can be programmed to generate interrupt microcontroller. Also the GPIO can be programmed to generated flexible power-on sequence for different CPU and chipset.

NCT6683D-LU monitors several critical parameters in hardware, including power supply voltages, fan speeds, and temperatures. In terms of temperature monitoring, NCT6683D-LU adopts the Current Mode (dual current source) and thermistor sensor approach, as well as PECI (Platform Environment Control Interface) and AMD SB-TSI interface. NCT6683D-LU also supports the Smart Fan control system, including "SMART FAN™ I and SMART FAN™ III and SMART Tracking, which makes the system more stable and user-friendly.

NCT6683D-LU supports SMBus host/slave function. As a master, it could access multiple slave devices; as a slave, it could be accessed for reporting useful information.

NCT6683D-LU provides an USB host interface to connect to USB device. Different kinds of USB application could be implemented by firmware.

NCT6683D-LU provides two high-speed serial communication ports (UART), each of them includes a 16-byte send/receive FIFO, a programmable baud rate generator, complete modem-control capability, and a processor interrupt system. The UART supports legacy speeds up to 115.2K bps as well as even higher baud rates of 230K, 460K or 921K bps to support higher speed moderms.

NCT6683D-LU supports the PC-compatible printer port (SPP), the bi-directional printer port (BPP), the enhanced parallel port (EPP) and the extended capabilities port (ECP).

2. FEATURES

- 1 T XC8051
- 16K bytes of data RAM
- MCU runs on EXTERNAL serial program storage (NOR Flash with SPI interface) on the fly directly. Address space up to 16M bytes was supported.(23-bit addressing).
- MCU interrupt on various system events, to enable glue logic enhancements and customization
- Access to any of NCT6683D-LU registers to provide:
  --- Control over the SIO pin selection.
  --- Control over the configuration of any NCT6683D-LU function or devices.
  --- Control and monitoring of any GPIO pin
- Peripherals
  --- 2 serial ports
  --- 3 timer counters
  --- Internal watchdog timer
  --- SMBus Interfaces used for:
    - Master : Temperature reading
    - Slave : Providing infrastructure for MCTP/PLDM and ASF-based manageability
    - Slave : Remote access to the device registers
  --- SPI interfaces
    - code fetch of NCT6683D-LU execution
  --- USB interface
- 14.318 MHz operation clock with crystal input (Xin / Xout)
- Adjustable internal clock for various utilizations
- Flexible ISP (In-System-Program) Interfaces
  --- LPC Bus
  --- SPI (from KBMS pin)

System Hardware Management Support

- Digital Thermal interfaces
  --- PECI 3.0 for Intel CPU thermal monitoring and support up to address 8 CPUs and 2 domains
  --- SB-TSI 1.0/APML for AMD CPU thermal monitoring
  --- SMBus devices.
- Local and remote Thermal measurement sensors
  --- external Thermal Diode or Thermistor monitor interfaces
  --- internal Thermal measurement diode
- Incorporates 8-bit analog-to-digital converter
  --- Analog inputs filtering
  --- Firmware-based digital filtering
  --- Remote thermal sensing designed for typical precision of 1 ^{o}C.
  --- 0.125 ^{o}C resolution.
- Fan Monitor and Control
  --- Adaptive fan control algorithm
  --- 8 PWM-based output fan controls
  --- Up to 8 fan speed monitoring inputs with 12-bit resolution tachometers
  --- Automatic temperature feedback control.
- Generates SMI on critical temperature events
- Voltage Monitoring

--- Up to 10 VIN
--- VSB, AVSB, VCC3
--- VBAT

General Purpose I/O Ports

- GPIO pins can be used either by the MCU or by the host
- All GPIO pins individually configured as input or output
- Programmable features for each output pin:
  --- Drive type (open-drain, push-pull or TRI-STATE
  --- TRI-STATE condition on detection of falling VDD3 for VSB3-powered pins driving VDD-supplied devices
- Programmable option for internal pull-up resistor on some input pin (some with internal pull-down resistor option)
- Lock option for the configuration and data of each GPIO port
- 16 pins can generate MCU interrupt events for the internal microcontroller
- GPIO pins generate IRQ/SIOPME/SMI for wake-up events. Each GPIO has separate:
  --- Enable control of event status routing to IRQ (For Each GPIO Input)
  --- Enable control of event status routing to SIOPME (Only for GPIO Enhance port)
  --- Polarity and edge/level selection
  --- Optional de-bouncing

Diagnostics

- High current driver power indicator LED blinking
  --- Dual Color Control
  --- Fading Mode
- Support two ports for Port80-like message output. Each port supports two digits.
  --- Directly drive 7-Segment LEDs
  --- The decode port is configurable.
  --- To save pin counts, it would be better to support 4 digits with same 7 data pins(LEDA~LEDG).
  --- Through UART port

Fail-safe ACPI and Optional Firmware-Enhanced Features (Control through EC Space)

- ACPI power sequence controls and glue logics, such as RSMRST#, PSON#, PWROK0, RSTOUT0#, PSIN, PSOUT#, ATXPGD, SLP_S3#, SLP_S5#,
  --- Main Power good / power OK signals ATXPGD and internal power sensing.
  --- Power distribution control (for switching between Main and Standby regulators)
  --- Main power supply turn on (PSON#)
  --- Resume reset (Master Reset) according to the stand-by 3V
  --- Reset button de-bouncer
  --- Power Good out mechanism using ATXPGD and internal power sensing
  --- Buffers PCI_RESET to generate 3 reset output signals
- Power restoring policy when AC was recovered
- Advanced watch dog timers
- Hardware Monitoring (including voltage sources, analog / digital / virtual temperature sources, and tachometers)
- Customizable handling about SKTOCC#, CASEOPEN# signals
  --- Battery-backed CaseOpen Alert
- Facilities for modern digital sensor interface, such as PECI 3.0, DIMM temperature pushing back, DIMM Ambient Temperature writing back, Sandy Bridge PCH, SMBus sensors, and automatic polling engines …
- Smart fan control algorithms such as Thermal Cruise, Speed Cruise, Smart Fan 3, Smart Fan 4, DTS1.0 and DTS2.0 Control, and Smart Tracking for both Duty/RPM control
- Front Panel Power LED with different blinking patterns and fading effect
- Port 80 Message Buffering with / without 7-segment LED driving
- Up to 5 CIR keys to wake up system from sleep state
- OEM SMBus Slave Interface to allow hardware control from SMBus master such as BMC
- Intel cTDP and LPM support

Power Management

- Supports ACPI Specification Revision 3.0, September 2004
- System Wake-Up Control (SWC)
  --- VSB3-powered event detection and event-logic configuration
  --- Optional routing of events to generate SIOPME
- SIOPME on detection of:
  --- Keyboard key strokes
  --- Mouse movement and/or button click
  --- Ring Indication RI on each of the two serial ports
  --- General-Purpose Input Events from 16 GPIO pins
  --- IRQs of the Keyboard and Mouse Controller
  --- IRQs of the other internal modules
  --- Optional routing of the SCI (SIOPME) to generate IRQ (SERIRQ)
  --- Implements GPE1_BLK of the ACPI General Purpose
- Power status indications
  — VBAT-powered indication of the Main power supply state before an AC power failure
- Extended Power and Wake-Up Control
  — Complements chipset's ACPI controller
  — Low Battery indication
- Advanced Power Saving Control

General

- SMBus access into any of the device registers for data read and configuration

- LPC Bus Interface
  --- Based on Intel's LPC Interface Specification Revision 1.1, August 2002
  --- I/O, Memory and 8-bit Firmware Memory read and write cycles
  --- Up to four 8-bit DMA channels and support LPC DMA
  --- 15 IRQ routing options to serial IRQ
- Configuration Control
  --- PnP Configuration Register structure
  --- Compliant with PC2001 Specification Revision 1.0, 1999-2000
  --- Pre-configurable Base Address of Super I/O Index-Data register pair (defaults to 0x2Eh/ 0x2Fh)
  --- VSB3-powered pin multiplexing
- 5 V tolerance pins supported

LEGACY I/O Functions

- UARTx2
- Parallel port
- KBC
- Infrared
  SIR
  CIR – RLC (Running Length Code, could be used to parse RC5/RC6/QP protocols)
  CIR Receiving - long distance mode (demodulated) and wide band (modulated)
  CIR Emitting – 2 modulated emitting channel

Package

- 128-pin LQFP

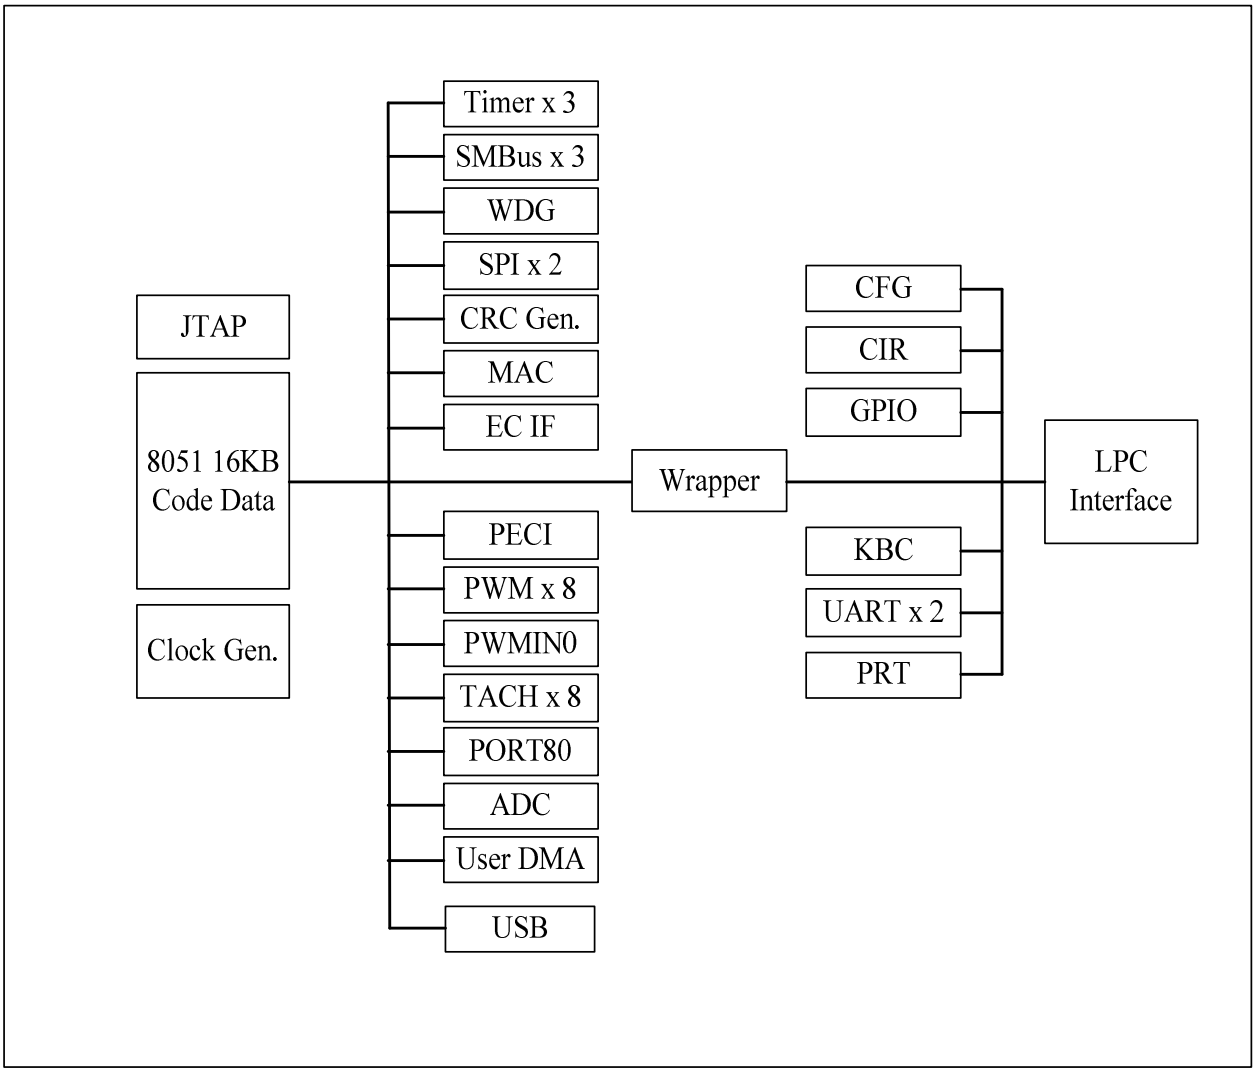

Figure 2-1 NCT6683D-LU Variants Block Diagram

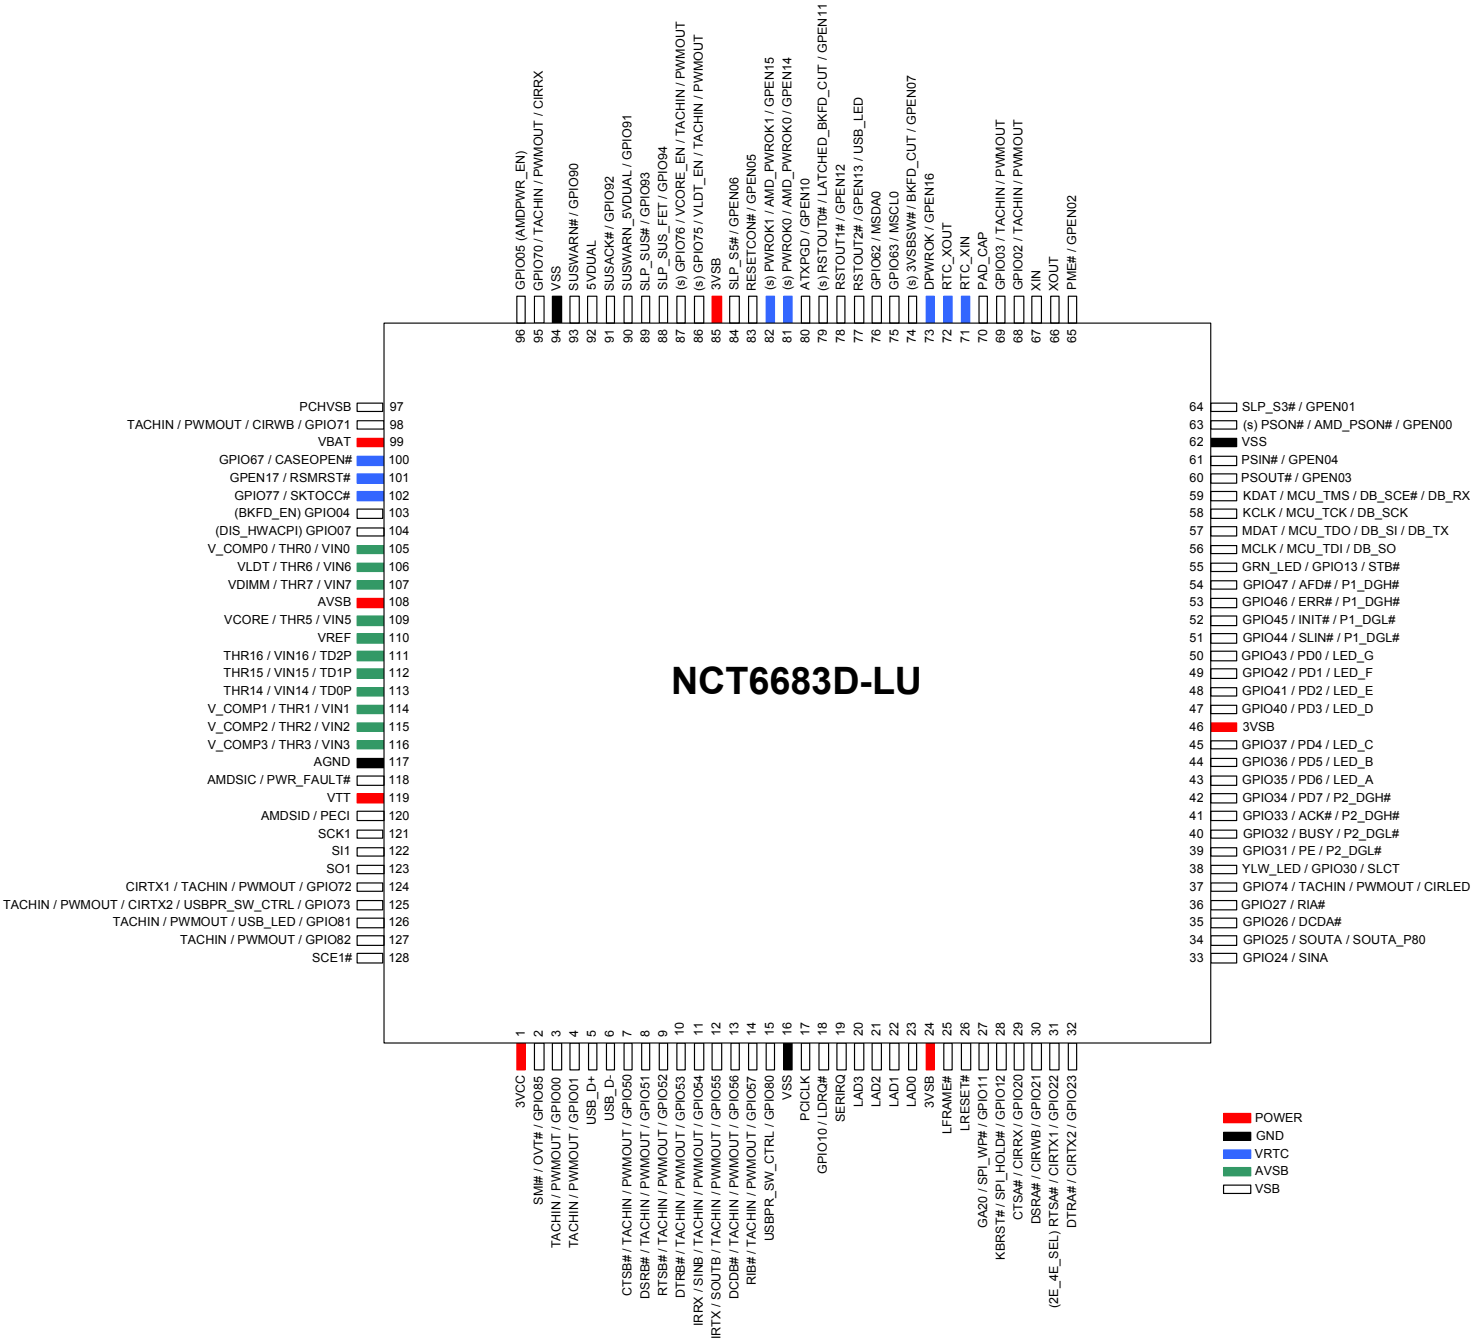
3. PIN LAYOUT

Figure 3-1 Pin Layout for NCT6683D-LU Variants



3.1 PIN MULTIPLEXING

PIN Num	Function_1 (Default)	Function_2	Function_3	Function_4
1	3VCC			
2	GPIO85	SMI#	OVT#	
3	GPIO00		TACHPWM	
4	GPIO01		TACHPWM

4. PIN DESCRIPTION

.

Note: Please refer to DC CHARACTERISTICS for details.

AOUT - Analog output pin
AIN - Analog input pin
IN_{tp3} - 3.3V TTL-level input pin
IN_{tsp3} - 3.3V TTL-level Schmitt-trigger input pin
IN_{tp5} - 5V TTL-level input pin
IN_{gp5} - 5V GTL-level input pin
IN_{tdp5} - 5V TTL level input pin with internal pull-down resistor
IN_{tsp5} - 5V TTL level Schmitt-trigger input pin
O_{12p3} - 3.3V output pin with 12-mA source-sink capability
OD_{12p3} - 3.3V open-drain output pin with 12-mA source-sink capability
O_{8p5} - 5V output pin with 8-mA source-sink capability
OD_{8p5} - 5V open-drain output pin with 8-mA source-sink capability
O_{12p5} - 5V output pin with 12-mA source-sink capability
OD_{12p5} - 5V open-drain output pin with 12-mA source-sink capability
O_{24p5} - 5V output pin with 24-mA source-sink capability
OD_{24p5} - 5V open-drain output pin with 24-mA source-sink capability
I/O_{v3} - Bi-direction pin with source capability of 6 mA and sink capability of 1 mA

4.1 LPC Interface

SYMBOL	PIN	I/O	DESCRIPTION
PME#	65	OD_{12p5}	Generated PME event.
PCICLK	17	IN_{tp5}	PCI-clock 33-MHz input.
LDRQ#	18	O_{12p5}	Encoded DMA Request signal.
SERIRQ	19	IN_{tp3} O_{12p3} OD_{12p3}	Serialized IRQ input / output.
LAD[3:0]	20-23	IN_{tp3} OD_{12p3}	These signal lines communicate address, control, and data information over the LPC bus between a host and a peripheral.
LFRAME#	25	IN_{tp3}	Indicates the start of a new cycle or the termination of a broken cycle.
LRESET#	26	IN_{tsp3}	Reset signal. It can be connected to the PCIRST# signal on the host.

4.2 Multi-Mode Parallel Port

SYMBOL	PIN	I/O	DESCRIPTION
SLCT	38	IN_{tsp5}	PRINTER MODE: An active-high input on this pin indicates that the printer is selected. See the description of the parallel port for the definition of this pin in ECP and EPP modes.
PE	39	IN_{tsp5}	PRINTER MODE: An active-high input on this pin indicates that the printer has detected the end of the paper. See the description of the parallel port for the definitions of this pin in ECP and EPP modes.
BUSY	40	IN_{tsp5}	PRINTER MODE: An active-high input indicates that the printer is not ready to receive data. See the description of the parallel port for the definitions of this pin in ECP and EPP modes.
ACK#	41	IN_{tsp5}	PRINTER MODE: ACK# An active-low input on this pin indicates that the printer has received data and is ready to accept more data. See the descriptions of the parallel port for the definition of this pin in ECP and EPP modes.
ERR#	53	IN_{tsp5}	PRINTER MODE: ERR# An active-low input on this pin indicates that the printer has encountered an error condition. See the description of the parallel port for the definitions of this pin in ECP and EPP modes.
SLIN#	51	O_{24p5}	PRINTER MODE: SLIN# Output line for detection of printer selection. See the description of the parallel port for the definitions of this pin in ECP and EPP modes.

SYMBOL	PIN	I/O	DESCRIPTION
INIT#	52	O_{24p5}	PRINTER MODE: INIT# Output line for the printer initialization. See the description of the parallel port for the definitions of this pin in ECP and EPP modes.
AFD#	54	O_{24p5}	PRINTER MODE: AFD# An active-low output from this pin causes the printer to auto feed a line after a line is printed. See the description of the parallel port for the definitions of this pin in ECP and EPP modes.
STB#	55	O_{12p5}	PRINTER MODE: STB# An active-low output is used to latch the parallel data into the printer. See the description of the parallel port for the definitions of this pin in ECP and EPP modes.
PD0	50	IN_{tp5} O_{24p5}	PRINTER MODE: PD0 Parallel port data bus bit 0. See the description of the parallel port for the definitions of this pin in ECP and EPP modes.
PD1	49	IN_{tp5} O_{24p5}	PRINTER MODE: PD1 Parallel port data bus bit 1. See the description of the parallel port for the definitions of this pin in ECP and EPP modes.
PD2	48	IN_{tp5} O_{24p5}	PRINTER MODE: PD2 Parallel port data bus bit 2. See the description of the parallel port for the definitions of this pin in ECP and EPP modes.
PD3	47	IN_{tp5} O_{24p5}	PRINTER MODE: PD3 Parallel port data bus bit 3. See the description of the parallel port for the definitions of this pin in ECP and EPP modes.
PD4	45	IN_{tp5} O_{24p5}	PRINTER MODE: PD4 Parallel port data bus bit 4. See the description of the parallel port for the definition of this pin in ECP and EPP modes.
PD5	44	IN_{tp5} O_{24p5}	PRINTER MODE: PD5 Parallel port data bus bit 5. See the description of the parallel port for the definitions of this pin in ECP and EPP modes.
PD6	43	IN_{tp5} O_{24p5}	PRINTER MODE: PD6 Parallel port data bus bit 6. See the description of the parallel port for the definitions of this pin in ECP and EPP modes.
PD7	42	IN_{tp5} O_{24p5}	PRINTER MODE: PD7 Parallel port data bus bit 7. See the description of the parallel port for the definitions of this pin in ECP and EPP modes.

4.3 Serial Port Interface

SYMBOL	PIN	I/O	DESCRIPTION
RIA#	36	IN_{tp5}	Ring Indicator. An active-low signal indicates that a ring signal is being received from the modem or the data set.
DCDA#	35	IN_{tp5}	Data Carrier Detection. An active-low signal indicates the modem or data set has detected a data carrier.
SOUTA	34	O_{12p5}	UART A Serial Output. This pin is used to transmit serial data out to the communication link.

SYMBOL	PIN	I/O	DESCRIPTION
SINA	33	IN_{tp5}	Serial Input. This pin is used to receive serial data through the communication link.
DTRA#	32	O_{12p5}	UART A Data Terminal Ready. An active-low signal informs the modem or data set that the controller is ready to communicate.
RTSA#	31	O_{12p5}	UART A Request To Send. An active-low signal informs the modem or data set that the controller is ready to send data.
DSRA#	30	IN_{tp5}	Data Set Ready. An active-low signal indicates the modem or data set is ready to establish a communication link and transfer data to the UART.
CTSA#	29	IN_{tp5}	Clear To Send. This is the modem-control input. The function of these pins can be tested by reading bit 4 of the handshake status register.
RIB#	14	IN_{tsp5}	Ring Indicator. An active-low signal indicates that a ring signal is being received from the modem or the data set.
DCDB#	13	IN_{tsp5}	Data Carrier Detection. An active-low signal indicates the modem or data set has detected a data carrier.
SOUTB	12	O_{12p5}	UART B Serial Output. This pin is used to transmit serial data out to the communication link.
SINB	11	IN_{tsp5}	Serial Input. This pin is used to receive serial data through the communication link.
DTRB#	10	O_{12p5}	UART B Data Terminal Ready. An active-low signal informs the modem or data set that the controller is ready to communicate.
RTSB#	9	O_{12p5}	UART B Request To Send. An active-low signal informs the modem or data set that the controller is ready to send data.
DSRB#	8	IN_{tsp5}	Data Set Ready. An active-low signal indicates the modem or data set is ready to establish a communication link and transfer data to the UART.
CTSB#	7	IN_{tsp5}	Clear To Send. This is the modem-control input. The function of these pins can be tested by reading bit 4 of the handshake status register.

4.4 KBC Interface

SYMBOL	PIN	I/O	DESCRIPTION
GA20	27	O_{12p5}	Gate A20 output. This pin is high after system reset. (KBC P21)
KBRST#	28	O_{12p5}	Keyboard reset. This pin is high after system reset. (KBC P20)
KCLK	58	IN_{tsp5} OD_{12p5}	Keyboard Clock.
KDAT	59	IN_{tsp5} OD_{12p5}	Keyboard Data.
MCLK	56	IN_{tsp5} OD_{12p5}	PS2 Mouse Clock.

SYMBOL	PIN	I/O	DESCRIPTION
MDAT	57	IN_{tsp5} OD_{12p5}	PS2 Mouse Data.

4.5 CIR Interface

SYMBOL	PIN	I/O	DESCRIPTION
CIRRX	29	IN_{tp5}	CIR input for long length
CIRRX	95	IN_{tsp5}	CIR input for long length
CIRTX1	31	O_{12p5}	CIR transmission output
CIRTX1	124	O_{12p5}	CIR transmission output
CIRTX2	32	O_{12p5}	CIR transmission output
CIRTX2	125	O_{12p5}	CIR transmission output
CIRWB	30	IN_{tp5}	CIR input for wide band.
CIRWB	98	IN_{tsp5}	CIR input for wide band.
CIRLED	37	O_{12p5} OD_{12p5}	Indicate CIR function is working. Nuvoton CIR driver support this function.

4.6 Hardware Monitor Interface

SYMBOL	PIN	I/O	DESCRIPTION
CASEOPEN#	100	IN_{tp5}	CASE OPEN detection. An active-low input from an external device when the case is open. This signal can be latched if pin VBAT is connected to the battery. Pulling up a 2-MΩ resistor to VBAT is recommended if not in use.
SKTOCC#	102	IN_{tp5}	CPU socket occupied detection
VREF	110	AOUT	Reference Voltage
V_COMP3	116	AIN	Analog input for voltage measurement (Range: 0 to 2.048 V)
V_COMP2	115	AIN	Analog input for voltage measurement (Range: 0 to 2.048 V)
V_COMP1	114	AIN	Analog input for voltage measurement (Range: 0 to 2.048 V)
V_COMP0	105	AIN	Analog input for voltage measurement (Range: 0 to 2.048 V)
VIN16	111	AIN	Analog input for voltage measurement (Range: 0 to 2.048 V)
VIN15	112	AIN	Analog input for voltage measurement (Range: 0 to 2.048 V)
VIN14	113	AIN	Analog input for voltage measurement (Range: 0 to 2.048 V)
VIN7	107	AIN	Analog input for voltage measurement (Range: 0 to 2.048 V)
VIN6	106	AIN	Analog input for voltage measurement (Range: 0 to 2.048 V)
VIN5	109	AIN	Analog input for voltage measurement (Range: 0 to 2.048 V)
VIN3	116	AIN	Analog input for voltage measurement (Range: 0 to 2.048 V)
VIN2	115	AIN	Analog input for voltage measurement (Range: 0 to 2.048 V)

SYMBOL	PIN	I/O	DESCRIPTION
VIN1	114	AIN	Analog input for voltage measurement (Range: 0 to 2.048 V)
VIN0	105	AIN	Analog input for voltage measurement (Range: 0 to 2.048 V)
THR16	111	AIN	Thermistor Input
THR15	112	AIN	Thermistor Input
THR14	113	AIN	Thermistor Input
THR7	107	AIN	Thermistor Input
THR6	106	AIN	Thermistor Input
THR5	109	AIN	Thermistor Input
THR3	116	AIN	Thermistor Input
THR2	115	AIN	Thermistor Input
THR1	114	AIN	Thermistor Input
THR0	105	AIN	Thermistor Input
TP2P	111	AIN	The input of temperature sensor 2.
TD1P	112	AIN	The input of temperature sensor 1.
TD0P	113	AIN	The input of temperature sensor 0.
OVT#	2	OD_{12p5}	The output of over temperature Shutdown. This pin indicates the temperature is over the temperature limit.
SMI#	2	OD_{12p5}	System Management Interrupt channel output.
TACHPWM	3	IN_{tsp5}	0 to +3 V amplitude fan tachometer input
		O_{12p5} OD_{12p5}	PWM duty-cycle signal for fan speed control.
TACHPWM	4	IN_{tsp5}	0 to +3 V amplitude fan tachometer input
		O_{12p5} OD_{12p5}	PWM duty-cycle signal for fan speed control.
TACHPWM	7	IN_{tsp5}	0 to +3 V amplitude fan tachometer input
		O_{12p5} OD_{12p5}	PWM duty-cycle signal for fan speed control.
TACHPWM	8	IN_{tsp5}	0 to +3 V amplitude fan tachometer input
		O_{12p5} OD_{12p5}	PWM duty-cycle signal for fan speed control.
TACHPWM	9	IN_{tsp5}	0 to +3 V amplitude fan tachometer input
		O_{12p5} OD_{12p5}	PWM duty-cycle signal for fan speed control.
TACHPWM	10	IN_{tsp5}	0 to +3 V amplitude fan tachometer input
		O_{12p5} OD_{12p5}	PWM duty-cycle signal for fan speed control.
TACHPWM	11	IN_{tsp5}	0 to +3 V amplitude fan tachometer input

SYMBOL	PIN	I/O	DESCRIPTION
		O_{12p5} OD_{12p5}	PWM duty-cycle signal for fan speed control.
TACHPWM	12	IN_{tsp5}	0 to +3 V amplitude fan tachometer input
		O_{12p5} OD_{12p5}	PWM duty-cycle signal for fan speed control.
TACHPWM	13	IN_{tsp5}	0 to +3 V amplitude fan tachometer input
		O_{12p5} OD_{12p5}	PWM duty-cycle signal for fan speed control.
TACHPWM	14	IN_{tsp5}	0 to +3 V amplitude fan tachometer input
		O_{12p5} OD_{12p5}	PWM duty-cycle signal for fan speed control.
TACHPWM	37	IN_{tsp5}	0 to +3 V amplitude fan tachometer input
		O_{12p5} OD_{12p5}	PWM duty-cycle signal for fan speed control.
TACHPWM	68	IN_{tsp5}	0 to +3 V amplitude fan tachometer input
		O_{12p5} OD_{12p5}	PWM duty-cycle signal for fan speed control.
TACHPWM	69	IN_{tsp5}	0 to +3 V amplitude fan tachometer input
		O_{12p5} OD_{12p5}	PWM duty-cycle signal for fan speed control.
TACHPWM	86	IN_{tsp5}	0 to +3 V amplitude fan tachometer input
		O_{12p5} OD_{12p5}	PWM duty-cycle signal for fan speed control.
TACHPWM	87	IN_{tsp5}	0 to +3 V amplitude fan tachometer input
		O_{12p5} OD_{12p5}	PWM duty-cycle signal for fan speed control.
TACHPWM	95	IN_{tsp5}	0 to +3 V amplitude fan tachometer input
		O_{12p5} OD_{12p5}	PWM duty-cycle signal for fan speed control.
TACHPWM	98	IN_{tsp5}	0 to +3 V amplitude fan tachometer input
		O_{12p5} OD_{12p5}	PWM duty-cycle signal for fan speed control.
TACHPWM	124	IN_{tsp5}	0 to +3 V amplitude fan tachometer input
		O_{12p5} OD_{12p5}	PWM duty-cycle signal for fan speed control.
TACHPWM	125	IN_{tsp5}	0 to +3 V amplitude fan tachometer input
		O_{12p5} OD_{12p5}	PWM duty-cycle signal for fan speed control.

SYMBOL	PIN	I/O	DESCRIPTION
TACHPWM	126	IN_{tsp5}	0 to +3 V amplitude fan tachometer input
		O_{12p5} OD_{12p5}	PWM duty-cycle signal for fan speed control.
TACHPWM	127	IN_{tsp5}	0 to +3 V amplitude fan tachometer input
		O_{12p5} OD_{12p5}	PWM duty-cycle signal for fan speed control.

4.7 SPI Interface

SCE1#	128	O_{12p5}	Chip enable of MCU SPI interface 1. MCU fetches code from this port.
SCK1	121	O_{12p5}	Clock out of MCU SPI interface 1. MCU fetches code from this port.
SI1	122	IN_{tp5} O_{12p5}	Serial data in of MCU SPI interface 1. MCU fetches code from this port.
SO1	123	IN_{tp5} O_{12p5}	Serial data out of MCU SPI interface 1. MCU fetches code from this port.
SPI_HOLD#	28	IN_{tp5} O_{12p5}	SPI flash hold pin. MCU can fetch code in quad mode operation from this port.
SPI_WP#	27	IN_{tp5} O_{12p5}	SPI flash write protect pin. MCU can fetch code in quad mode operation from this port.

4.8 PECI Interface

SYMBOL	PIN	I/O	DESCRIPTION
PECI	120	I/O_{V3}	INTEL® CPU PECI interface. Connect to CPU.

4.9 SB-TSI Interface

SYMBOL	PIN	I/O	DESCRIPTION
AMDSIC	118	OD_{12p3}	AMD® SB-TSI clock input
AMDSID	120	IN_{tsp3} OD_{12p3}	AMD® SB-TSI data input / output

4.10 Advanced Configuration & Power Interface

SYMBOL	PIN	I/O	DESCRIPTION
PSIN#	61	IN_{tp5}	Panel Switch Input. This pin is active-low with an internal pulled-up resistor.
PSOUT#	60	OD_{12p5}	Panel Switch Output. This signal is used to wake-up the system from S3/S5 state.

SYMBOL	PIN	I/O	DESCRIPTION
RSMRST#	101	OD_{8p5}	Resume reset signal output.
SLP_S3#	64	IN_{tp5}	SLP_S3# input.
SLP_S5#	84	IN_{tp5}	SLP_S5# input.
ATXPGD	80	IN_{tsp5}	ATX power good signal.
PSON#	63	OD_{12p5}	Power supply on-off output.
PWROK0	81	OD_{8p5}	3VCC PWROK0 signal.
PWROK1	82	OD_{8p5}	3VCC PWROK1 signal.
DPWROK	73	OD_{8p5}	V3A signal output
RESETCON#	83	IN_{tsp5}	Connect to the reset button.
RSTOUT0#	79	OD_{24p5}	PCI Reset Buffer 0.
RSTOUT1#	78	OD_{24p5}	PCI Reset Buffer 1.
RSTOUT2#	77	OD_{24p5}	PCI Reset Buffer 2.
3VSBSW#	74	O_{12p5}	3V Switch Auxiliary Enable. Controls switching 3V standby supply. Active low.
BKFD_CUT	74	OD_{12p5}	Power distribution control (When switching between main and standby regulators) for system transition into and out of the S3 sleep state.
LATCHED_BKFD_CUT	79	O_{24p5}	Power distribution control (When switching between main and standby regulators) for system transition into and out of the S5 sleep state.

4.11 Port 80 Message Display & LED Control

SYMBOL	PIN	I/O	DESCRIPTION
P1_DGH#	53	O_{24p5}	Common cathode output of high nibble display on decoded Port 1 (ex.: 0x80h) message. Switching frequency is about 10 KHz.
P1_DGH#	54	O_{24p5}	Common cathode output of high nibble display on decoded Port 1 (ex.: 0x80h) message. Switching frequency is about 10 KHz.
P1_DGL#	51	O_{24p5}	Common cathode output of low nibble display on decoded Port 1 (ex.: 0x80h) message. Switching frequency is about 10 KHz.
P1_DGL#	52	O_{24p5}	Common cathode output of low nibble display on decoded Port 1 (ex.: 0x80h) message. Switching frequency is about 10 KHz.
P2_DGH#	41	O_{24p5}	Common cathode output of high nibble display on decoded Port 2 message. Switching frequency is about 10 KHz.
P2_DGH#	42	O_{24p5}	Common cathode output of high nibble display on decoded Port 2 message. Switching frequency is about 10 KHz.
P2_DGL#	39	O_{24p5}	Common cathode output of low nibble display on decoded Port 2 message. Switching frequency is about 10 KHz.

P2_DGL#	40	O_{24p5}	Common cathode output of low nibble display on decoded Port 2 message. Switching frequency is about 10 KHz.
LED_A LED_B LED_C LED_D LED_E LED_F LED_G	43 44 45 47 48 49 50	O_{24p5}	Anode outputs for 7-Segment LED.
YLW_LED	38	OD_{12p5}	Yellow LED output control. This pin could indicate the power status.
GRN_LED	55	OD_{12p5}	Green LED output control. This pin could indicate the power status.

4.12 SMBus Interface

SYMBOL	PIN	I/O	DESCRIPTION
MSCL0	75	IN_{tsp5} OD_{12p5}	SMBus clock.
MSDA0	76	IN_{tsp5} OD_{12p5}	SMBus bi-directional Data.

4.13 USB

SYMBOL	PIN	I/O	DESCRIPTION
USB_D+	5	AOUT	USB PORT D-
USB_D-	6	AOUT	USB PORT D+
USBPR_SW_CTRL	15	O_{12p5}	USB power switch control
USBPR_SW_CTRL	125	O_{12p5}	USB power switch control
USB_LED	77	O_{24p5}	Lighting LED during BIOS updating
USB_LED	126	O_{12p5}	Lighting LED during BIOS updating

4.14 AMD Power-On Sequence

SYMBOL	PIN	I/O	DESCRIPTION
VCORE	109	AIN	Power sequence group B signal
VLDT	106	AIN	Power sequence group C signal
VDIMM	107	AIN	Memory power enable
VCORE_EN	87	OD_{12p5}	CPU Vcore power enable
VLDT_EN	86	OD_{12p5}	Hyper transport I/O power enable
AMD_PSON#	63	OD_{12p5}	Power supply on / off output to enable ATX

SYMBOL	PIN	I/O	DESCRIPTION
AMD_PWROK0	81	OD_{8p5}	AMD power on sequence ok signal
AMD_PWROK1	82	OD_{8p5}	AMD power on sequence ok signal

4.15 PORT80 to UART

SYMBOL	PIN	I/O	DESCRIPTION
SOUTA_P80	34	O_{12p5}	PORT80 serial output

4.16 IR

SYMBOL	PIN	I/O	DESCRIPTION
IRRX	11	IN_{tsp5}	IR Receiver input
IRTX	12	O_{12p5}	IR Transmitter output

4.17 Crystal Oscillator Pins

SYMBOL	PIN	DESCRIPTION
XIN	67	14.318MHz Crystal Oscillator input
XOUT	66	14.318MHz Crystal Oscillator output
RTC_XIN	71	32.768KHz RTC Timer Crystal Oscillator input
RTC_XOUT	72	32.768KHz RTC Timer Crystal Oscillator output

4.18 Strapping Pins

SYMBOL	PIN	DESCRIPTION
2E_4E_SEL	31	SIO I/O address selection (Strapped by LRESET#) 0: SIO I/O address is 2Eh/2Fh 1: SIO I/O address is 4Eh/4Fh
BKFD_EN	103	Pin74, Pin79 default function selection (Strapped by VSB power) 0: Pin74 → 3VSBSW#, Pin79 → RSTOUT0# 1: Pin74 → BKFD_CUT, Pin79 → LATCHED_BKFD_CUT
AMDPWR_EN	96	AMD Power Sequence Function (Strapped by VSB power) 0: Disable 1: Enable

SYMBOL	PIN	DESCRIPTION
DIS_HWACPI	104	ACPI default value setting (Strapped by VSB power) 0: Hardware ACPI could take over related signals 1: Hardware ACPI never take over related signals Output "0" : Pin73, 79, 101 Output "z" : Pin60, 63, 65, 74, 77, 78, 81, 82

4.19 Power Pins

SYMBOL	PIN	DESCRIPTION
3VSB	24, 46, 85	+3.3 V stand-by power supply for the digital circuits.
AVSB	108	+3.3 V stand-by power supply for the analog circuits.
VBAT	99	+3 V on-board battery for the digital circuits.
3VCC	1	+3.3 V power supply for driving 3 V on host interface.
AGND	117	Analog ground.
PAD_CAP	70	External Filter Capacitor 4.7u (for internal VSB 1.8V).
VTT	119	INTEL® CPU VTT power.
VSS	16, 62, 94	Ground.

4.20 General Purpose I/O Port

4.20.1 GPIO-0 Interface

SYMBOL	PIN	I/O	DESCRIPTION
GP00	3	IN_{tsp5} O_{12p5} OD_{12p5}	General-purpose I/O port 0 bit 0.
GP01	4	IN_{tsp5} O_{12p5} OD_{12p5}	General-purpose I/O port 0 bit 1.
GP02	68	IN_{tsp5} O_{12p5} OD_{12p5}	General-purpose I/O port 0 bit 2.
GP03	69	IN_{tsp5} O_{12p5} OD_{12p5}	General-purpose I/O port 0 bit 3.
GP04	103	IN_{tp5} O_{12p5} OD_{12p5}	General-purpose I/O port 0 bit 4.
GP05	96	IN_{tp5} O_{12p5} OD_{12p5}	General-purpose I/O port 0 bit 5.

SYMBOL	PIN	I/O	DESCRIPTION
GP07	104	IN_{tp5} O_{12p5} OD_{12p5}	General-purpose I/O port 0 bit 7.

4.20.2 GPIO-1 Interface

SYMBOL	PIN	I/O	DESCRIPTION
GP10	18	IN_{tp5} O_{12p5} OD_{12p5}	General-purpose I/O port 1 bit 0.
GP11	27	IN_{tp5} O_{12p5} OD_{12p5}	General-purpose I/O port 1 bit 1.
GP12	28	IN_{tp5} O_{12p5} OD_{12p5}	General-purpose I/O port 1 bit 2.
GP13	55	IN_{tsp5} O_{12p5} OD_{12p5}	General-purpose I/O port 1 bit 3.

4.20.3 GPIO-2 Interface

SYMBOL	PIN	I/O	DESCRIPTION
GP20	29	IN_{tdp5} O_{12p5} OD_{12p5}	General-purpose I/O port 2 bit 0.
GP21	30	IN_{tdp5} O_{12p5} OD_{12p5}	General-purpose I/O port 2 bit 1.
GP22	31	IN_{tdp5} O_{12p5} OD_{12p5}	General-purpose I/O port 2 bit 2.
GP23	32	IN_{tdp5} O_{12p5} OD_{12p5}	General-purpose I/O port 2 bit 3.
GP24	33	IN_{tdp5} O_{12p5} OD_{12p5}	General-purpose I/O port 2 bit 4.
GP25	34	IN_{tdp5} O_{12p5} OD_{12p5}	General-purpose I/O port 2 bit 5.

SYMBOL	PIN	I/O	DESCRIPTION
GP26	35	IN_{tdp5} O_{12p5} OD_{12p5}	General-purpose I/O port 2 bit 6.
GP27	36	IN_{tdp5} O_{12p5} OD_{12p5}	General-purpose I/O port 2 bit 7.

4.20.4 GPIO-3 Interface

SYMBOL	PIN	I/O	DESCRIPTION
GP30	38	IN_{tsp5} O_{12p5} OD_{12p5}	General-purpose I/O port 3 bit 0.
GP31	39	IN_{tsp5} O_{24p5} OD_{24p5}	General-purpose I/O port 3 bit 1.
GP32	40	IN_{tsp5} O_{24p5} OD_{24p5}	General-purpose I/O port 3 bit 2.
GP33	41	IN_{tsp5} O_{24p5} OD_{24p5}	General-purpose I/O port 3 bit 3.
GP34	42	IN_{tp5} O_{24p5} OD_{24p5}	General-purpose I/O port 3 bit 4.
GP35	43	IN_{tp5} O_{24p5} OD_{24p5}	General-purpose I/O port 3 bit 5.
GP36	44	IN_{tp5} O_{24p5} OD_{24p5}	General-purpose I/O port 3 bit 6.
GP37	45	IN_{tp5} O_{24p5} OD_{24p5}	General-purpose I/O port 3 bit 7.

4.20.5 GPIO-4 Interface

SYMBOL	PIN	I/O	DESCRIPTION
GP40	47	IN_{tp5} O_{24p5} OD_{24p5}	General-purpose I/O port 4 bit 0.

SYMBOL	PIN	I/O	DESCRIPTION
GP41	48	IN_{tp5} O_{24p5} OD_{24p5}	General-purpose I/O port 4 bit 1.
GP42	49	IN_{tp5} O_{24p5} OD_{24p5}	General-purpose I/O port 4 bit 2.
GP43	50	IN_{tp5} O_{24p5} OD_{24p5}	General-purpose I/O port 4 bit 3.
GP44	51	IN_{tsp5} O_{24p5} OD_{24p5}	General-purpose I/O port 4 bit 4.
GP45	52	IN_{tsp5} O_{24p5} OD_{24p5}	General-purpose I/O port 4 bit 5.
GP46	53	IN_{tsp5} O_{24p5} OD_{24p5}	General-purpose I/O port 4 bit 6.
GP47	54	IN_{tsp5} O_{24p5} OD_{24p5}	General-purpose I/O port 4 bit 7.

4.20.6 GPIO-5 Interface

SYMBOL	PIN	I/O	DESCRIPTION
GP50	7	IN_{tsp5} O_{12p5} OD_{12p5}	General-purpose I/O port 5 bit 0.
GP51	8	IN_{tsp5} O_{12p5} OD_{12p5}	General-purpose I/O port 5 bit 1.
GP52	9	IN_{tsp5} O_{12p5} OD_{12p5}	General-purpose I/O port 5 bit 2.
GP53	10	IN_{tsp5} O_{12p5} OD_{12p5}	General-purpose I/O port 5 bit 3.
GP54	11	IN_{tsp5} O_{12p5} OD_{12p5}	General-purpose I/O port 5 bit 4.

SYMBOL	PIN	I/O	DESCRIPTION
GP55	12	IN_{tsp5} O_{12p5} OD_{12p5}	General-purpose I/O port 5 bit 5.
GP56	13	IN_{tsp5} O_{12p5} OD_{12p5}	General-purpose I/O port 5 bit 6.
GP57	14	IN_{tsp5} O_{12p5} OD_{12p5}	General-purpose I/O port 5 bit 7.

4.20.7 GPIO-6 Interface

SYMBOL	PIN	I/O	DESCRIPTION
GP62	76	IN_{tsp5} O_{12p5} OD_{12p5}	General-purpose I/O port 6 bit 2.
GP63	75	IN_{tsp5} O_{12p5} OD_{12p5}	General-purpose I/O port 6 bit 3.
GP67	100	IN_{tp5} O_{8p5} OD_{8p5}	General-purpose I/O port 6 bit 7.

4.20.8 GPIO-7 Interface

SYMBOL	PIN	I/O	DESCRIPTION
GP70	95	IN_{tsp5} O_{12p5} OD_{12p5}	General-purpose I/O port 7 bit 0.
GP71	98	IN_{tsp5} O_{12p5} OD_{12p5}	General-purpose I/O port 7 bit 1.
GP72	124	IN_{tsp5} O_{12p5} OD_{12p5}	General-purpose I/O port 7 bit 2.
GP73	125	IN_{tsp5} O_{12p5} OD_{12p5}	General-purpose I/O port 7 bit 3.
GP74	37	IN_{tsp5} O_{12p5} OD_{12p5}	General-purpose I/O port 7 bit 4.

SYMBOL	PIN	I/O	DESCRIPTION
GP75	86	IN_{tsp5} O_{12p5} OD_{12p5}	General-purpose I/O port 7 bit 5.
GP76	87	IN_{tsp5} O_{12p5} OD_{12p5}	General-purpose I/O port 7 bit 6.
GP77	102	IN_{tp5} O_{8p5} OD_{8p5}	General-purpose I/O port 7 bit 7.

4.20.9 GPIO-8 Interface

SYMBOL	PIN	I/O	DESCRIPTION
GP80	15	IN_{tp5} O_{12p5} OD_{12p5}	General-purpose I/O port 8 bit 0.
GP81	126	IN_{tsp5} O_{12p5} OD_{12p5}	General-purpose I/O port 8 bit 1.
GP82	127	IN_{tsp5} O_{12p5} OD_{12p5}	General-purpose I/O port 8 bit 2.
GP85	2	IN_{tp5} O_{12p5} OD_{12p5}	General-purpose I/O port 8 bit 5.

4.20.1 GPIO-9 Interface

SYMBOL	PIN	I/O	DESCRIPTION
GP90	93	IN_{tp5} O_{12p5} OD_{12p5}	General-purpose I/O port 9 bit 0.
GP91	90	IN_{tp5} O_{12p5} OD_{12p5}	General-purpose I/O port 9 bit 1.
GP92	91	IN_{tp5} O_{12p5} OD_{12p5}	General-purpose I/O port 9 bit 2.
GP93	89	IN_{tp5} O_{12p5} OD_{12p5}	General-purpose I/O port 9 bit 3.

SYMBOL	PIN	I/O	DESCRIPTION
GP94	88	IN_{tp5} O_{12p5} OD_{12p5}	General-purpose I/O port 9 bit 4.

4.20.2 GPIO EN0 Interface

SYMBOL	PIN	I/O	DESCRIPTION
GPEN00	63	IN_{tp5} O_{12p5} OD_{12p5}	General-purpose I/O port EN0 bit 0.
GPEN01	64	IN_{tp5} O_{12p5} OD_{12p5}	General-purpose I/O port EN0 bit 1.
GPEN02	65	IN_{tp5} O_{12p5} OD_{12p5}	General-purpose I/O port EN0 bit 2.
GPEN03	60	IN_{tp5} O_{12p5} OD_{12p5}	General-purpose I/O port EN0 bit 3.
GPEN04	61	IN_{tp5} O_{8p5} OD_{8p5}	General-purpose I/O port EN0 bit 4.
GPEN05	83	IN_{tsp5} O_{12p5} OD_{12p5}	General-purpose I/O port EN0 bit 5.
GPEN06	84	IN_{tp5} O_{12p5} OD_{12p5}	General-purpose I/O port EN0 bit 6.
GPEN07	74	IN_{tp5} O_{12p5} OD_{12p5}	General-purpose I/O port EN0 bit 7.

4.20.3 GPIO EN1 Interface

SYMBOL	PIN	I/O	DESCRIPTION
GPEN10	80	IN_{tsp5} O_{12p5} OD_{12p5}	General-purpose I/O port EN0 bit 0.
GPEN11	79	IN_{tp5} O_{24p5} OD_{24p5}	General-purpose I/O port EN0 bit 1.

SYMBOL	PIN	I/O	DESCRIPTION
GPEN12	78	IN_{tp5} O_{24p5} OD_{24p5}	General-purpose I/O port EN0 bit 2.
GPEN13	77	IN_{tp5} O_{24p5} OD_{24p5}	General-purpose I/O port EN0 bit 3.
GPEN14	81	IN_{tp5} O_{8p5} OD_{8p5}	General-purpose I/O port EN0 bit 4.
GPEN15	82	IN_{tp5} O_{8p5} OD_{8p5}	General-purpose I/O port EN0 bit 5.
GPEN16	73	IN_{tp5} O_{8p5} OD_{8p5}	General-purpose I/O port EN0 bit 6.
GPEN17	101	IN_{tp5} O_{8p5} OD_{8p5}	General-purpose I/O port EN0 bit 7.

4.21 Debug PORT Test

SYMBOL	PIN	I/O	DESCRIPTION
DB_RX	59	IN_{tsp5}	Serial data into MCU UART RX
DB_TX	57	O_{12p5}	Serial data from MCU UART TX
DB_SCK	58	IN_{tsp5}	Patch signal SCK
DB_SI	57	IN_{tsp5}	Patch signal SI
DB_SO	56	O_{12p5}	Patch signal SO
DB_SCE#	59	IN_{tsp5}	Patch signal SCE#
MCU_TCK	58	IN_{tsp5}	Debug Port MCU JTAG clock
MCU_TMS	59	IN_{tsp5}	Debug Port MCU JTAG mode select
MCU_TDO	57	O_{12p5}	Debug Port MCU JTAG data out
MCU_TDI	56	IN_{tsp5}	Debug Port MCU JTAG data in

4.22 DSW

SYMBOL	PIN	I/O	DESCRIPTION
PCHVSB	97	AIN	PCHVSB function
SUSWARN#	93	IN_{tp5}	This pin connects to SUSWARN# in CPT PCH
5VDUAL	92	AIN	Analog input to monitor 5VDUAL voltate

SYMBOL	PIN	I/O	DESCRIPTION
SUSWARN_5VDUAL	90	OD_{12p5}	This pin links to external 5VDUAL control circuits
SUSACK#	91	OD_{12p5}	This pin connects to SUSACK# in CPT PCH
SLP_SUS#	89	IN_{tp5}	This pin connects to SLP_SUS# in CPT PCH
SLP_SUS_FET	88	OD_{12p5}	This pin connects to VSB power switch

4.23 Intel Power Fault

SYMBOL	PIN	I/O	DESCRIPTION
PWR_FAULT#	118	OD_{12p5}	Intel Power Fault output

4.24 Internal pull-up, pull-down pins

Signal	Pin(s)	Power well	Type	Resistor	Note
GPIO					
GP20~GP27	29~36	3VSB	Pull-down	47.03KΩ	1

Note1. Programmable

5. GLUE LOGIC

5.1 Fail-safe ACPI Glue Logic

Table 5-1 Pin Description

SYMBOL	PIN	DESCRIPTION
SLP_S5#	84	SLP_S5# input.
RESETCON#	83	RESETCON# input signal. This pin has internal de-bounce circuit whose de-bounce time is at least 16 mS.
PWROK0	81	This pin generates the PWROK signals while 3VCC is present.
PWROK1	82	This pin generates the PWROK signals while 3VCC is present.
DPWROK#	73	This pin generates the DPWROK# signals while 3VSB is present.
ATXPGD	80	ATX power good input signal. It is connected to the PWROK signal from the power supply for PWROK/PWRGD generation. The default is enabled.
RSMRST#	101	The RSMRST# signal is a reset output and is used as the VSB power on reset signal for the South Bridge. When the NCT6683D-LU detects the 3VSB voltage rises to “V1”, it then starts a delay – “t1” before the rising edge of RSMRST# asserting. If the 3VSB voltage falls below “V2”, the RSMRST# de-asserts immediately.

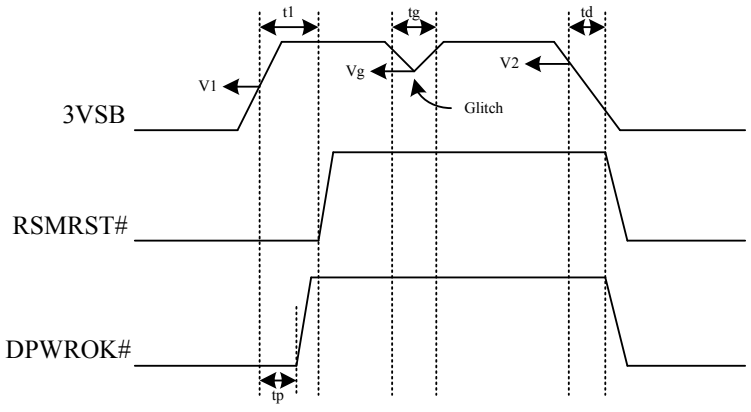

Figure 5-2 RSMRST# and DPWROK#

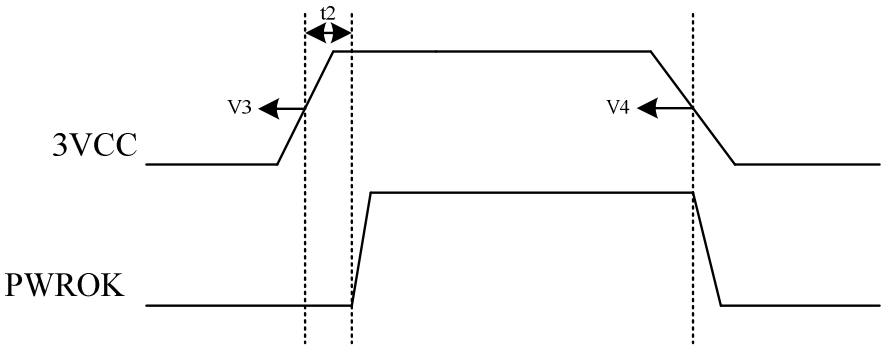

Figure 5-3 PWROK

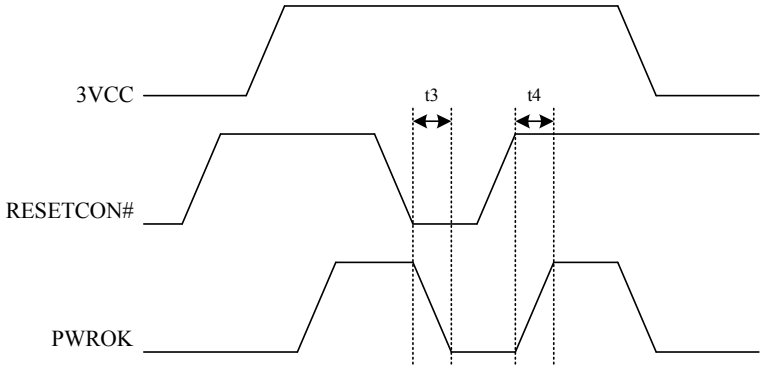

Figure 5-4 RESETCON# and PWROK (Default Disable)

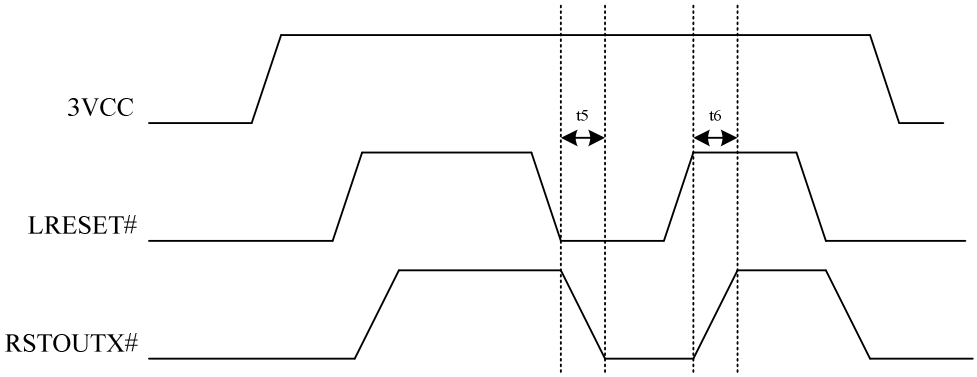

Figure 5-5 RSTOUTX# and LRESET#

TIMING	PARAMETER	MIN	MAX	UNIT
t1	Valid 3VSB to RSMRST# inactive	200	300	mS
tp	Valid 3VSB to DPWROK# inactive	10	30	mS
tg	3VSB Glitch allowance		1	uS
td	Falling 3VSB supply Delay		1	uS

TIMING	PARAMETER	MIN	MAX	UNIT
t2	Valid 3VCC to PWROK active	300	500	mS
t3	RESETCON# active to PWROK inactive	0	80	nS
t4	RESETCON# inactive to PWROK active	0	80	nS
t5	LRESET# active to RSTOUTx# active	0	80	nS
t6	LRESET# inactive to RSTOUTx# inactive	0	80	nS

DC	PARAMETER	MIN	MAX	UNIT
V1	3VSB Valid Voltage	-	3.033	Volt
V2	3VSB Ineffective Voltage	2.882	-	Volt
V3	3VCC Valid Voltage	-	2.83	Volt
V4	3VCC Ineffective Voltage	2.68	-	Volt
Vg	3VSB drops by Power noise	2	-	Volt

Note： 1. The values above are the worst-case results of R&D simulation.

5.2 Fail-safe BKFD_CUT and LATCHED_BF_CUT

NCT6683D-LU supports BKFD_CUT and LATCHED_BF_CUT functions please refer the timing diagram below:

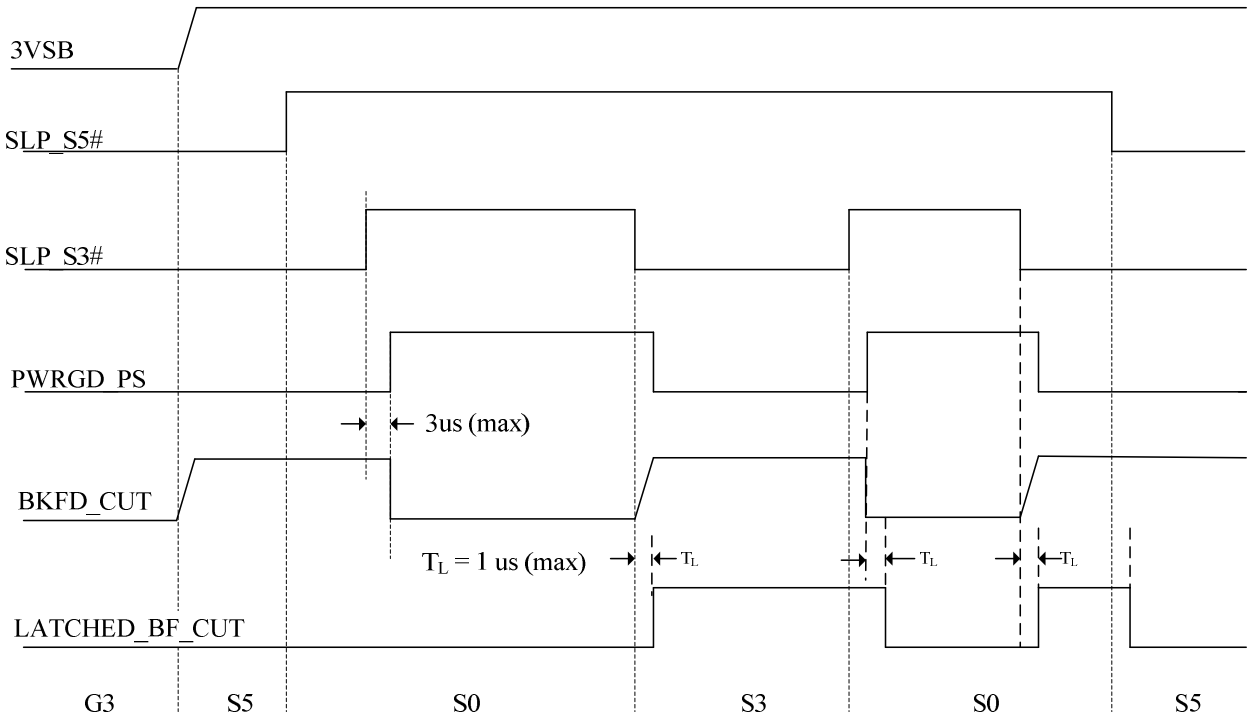

Figure 5-6 BKFD_CUT and LATCH_BKFD_CUT

BKFD_CUT (Backfeed_Cut) – When high, switches dual rails to standby power.

LATCH_BKFD_CUT (Latched_Backfeed_Cut) – When high, switches dual rails to standby power.

5.3 Fail-safe 3VSBSW#

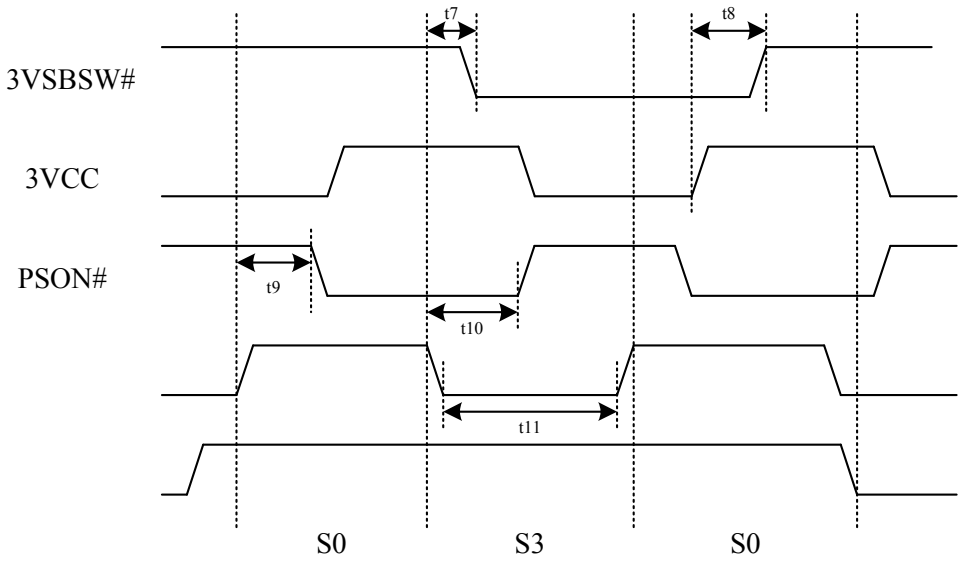

Figure 5-7 3VSBSW#

TIMING	PARAMETER	MIN	MAX	UNIT
t7	SLP_S3# active to 3VSBSW# active	0	10	mS
t8	3VCC active to 3VSBSW# inactive	120	190	mS
t9	SLP_S3# inactive to PSON# active	0	80	nS
t10	SLP_S3# active to PSON# inactive	15	45	mS
t11	SLP_S3# minimal Low Time	40	-	mS

5.4 Fail-safe PSON# Block Diagram

The PSON# function controls the main power on/off. The main power is turned on when PSON# is low. Please refer to the figure below.

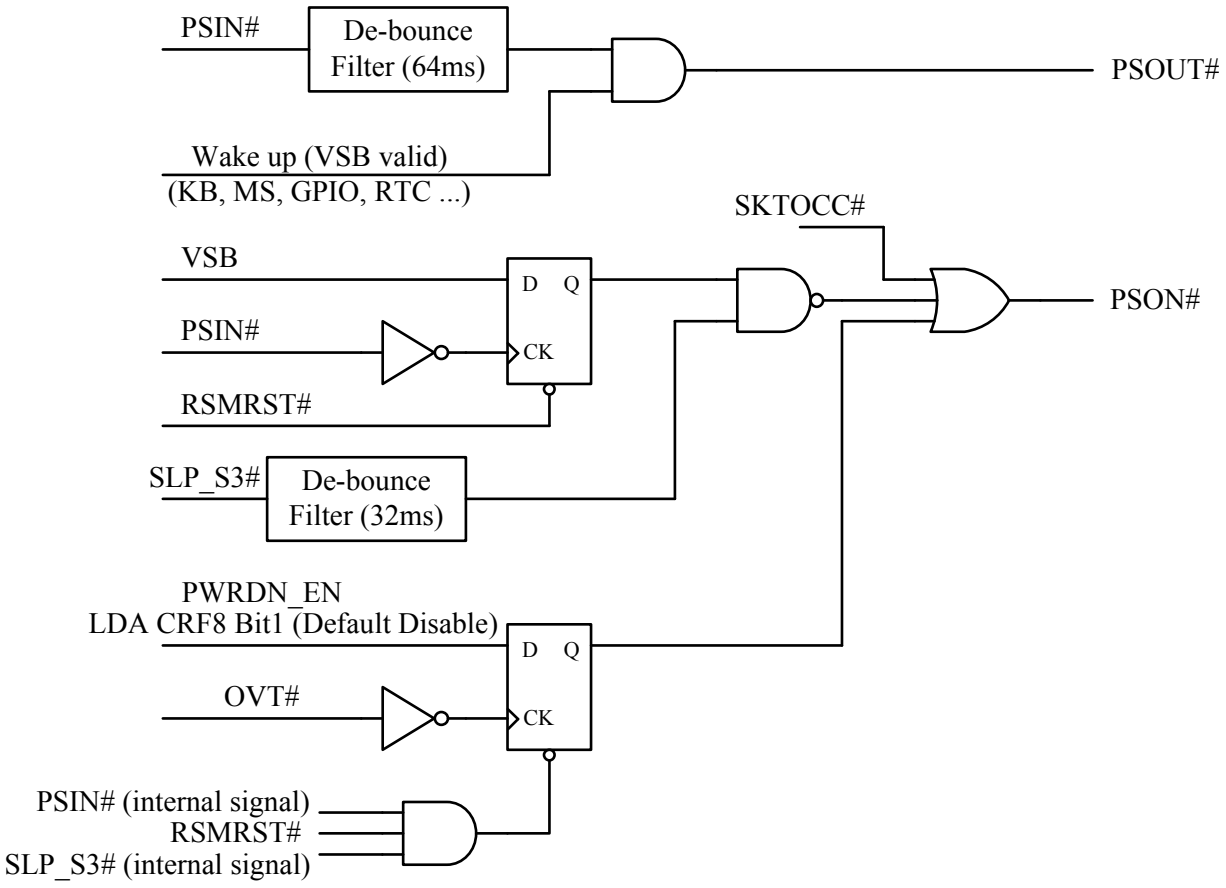

Figure 5-8 PSON# Block Diagram

5.5 Fail-safe PWROK Block Diagram

The PWROK signal indicates the main power (VCC Power) is valid. Besides, valid PWROK signal also requires the following conditions, as shown in the figure below.

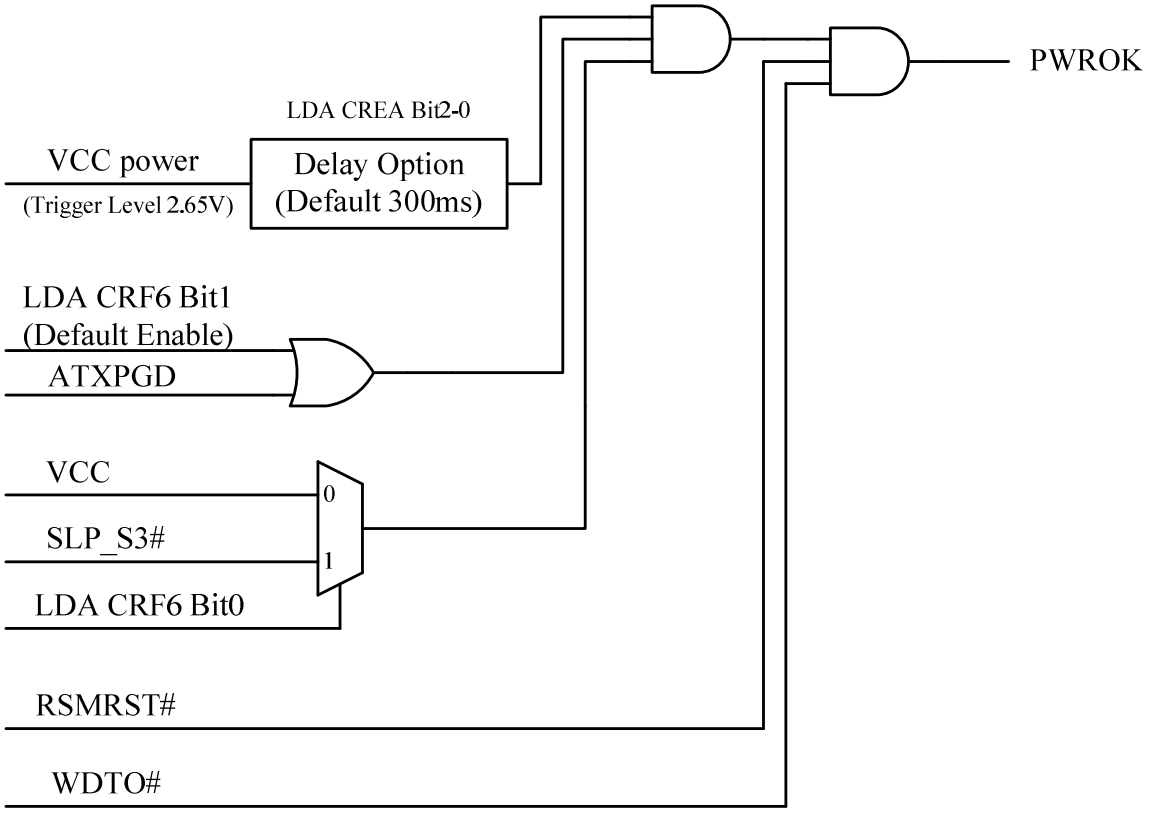

Figure 5-9 PWROK Block Diagram

5.6 Fail-safe AMD Power-On Sequence

The NCT6683D-LU supports new AMD power on sequence bace on ACPI power on sequence.

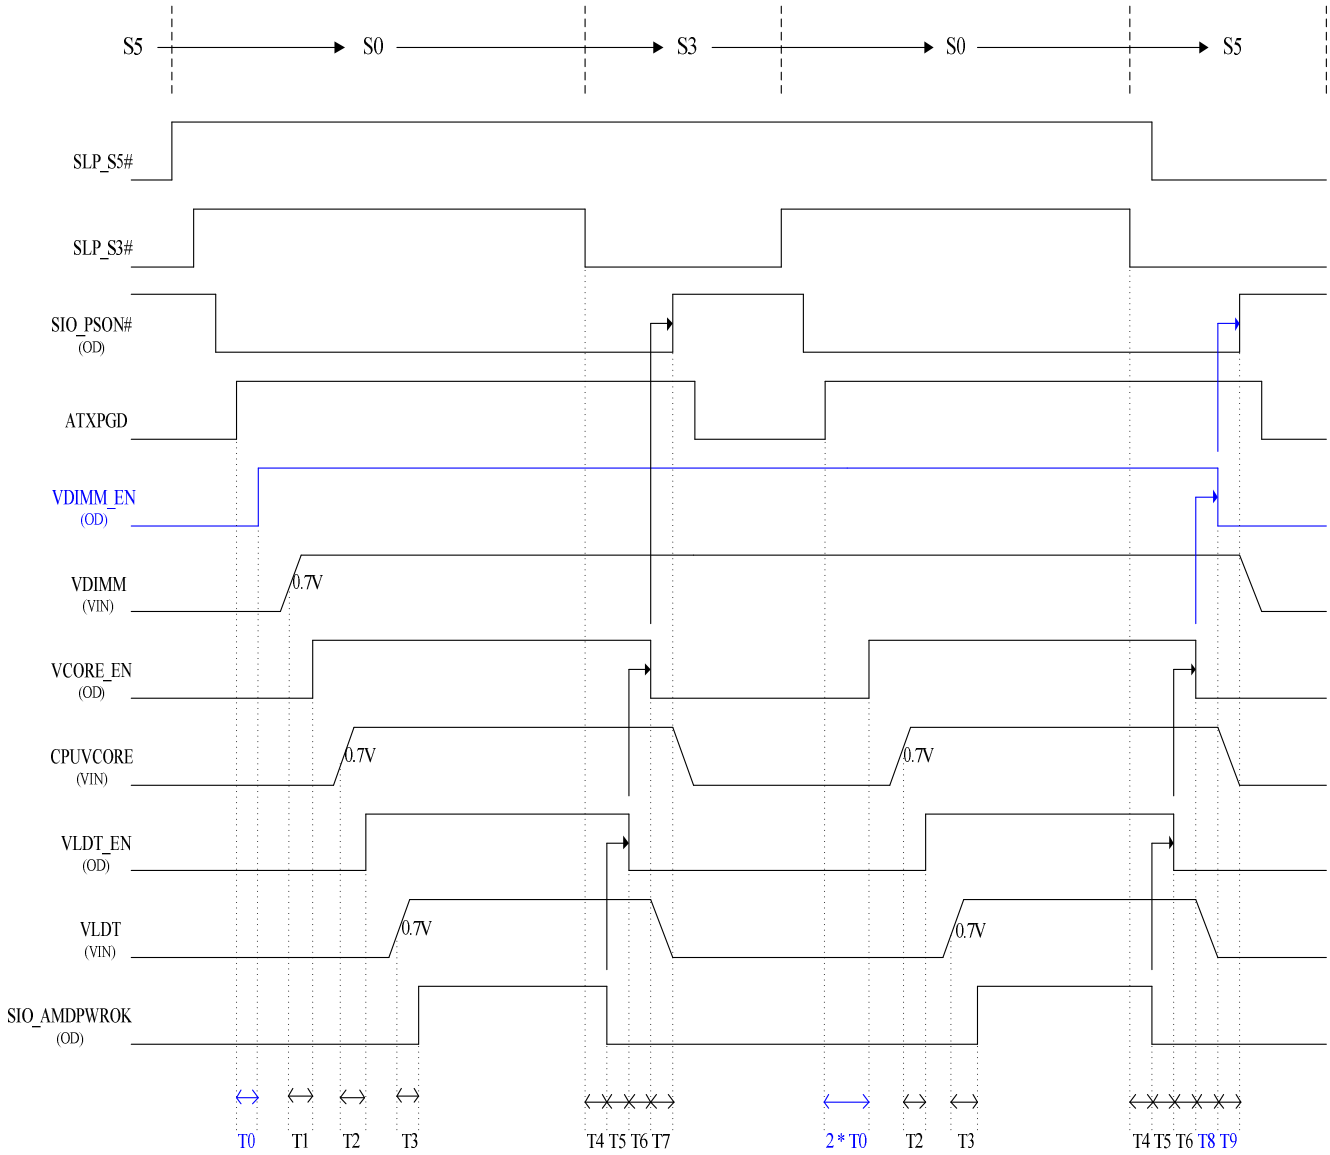

Figure 5-11 non level detect

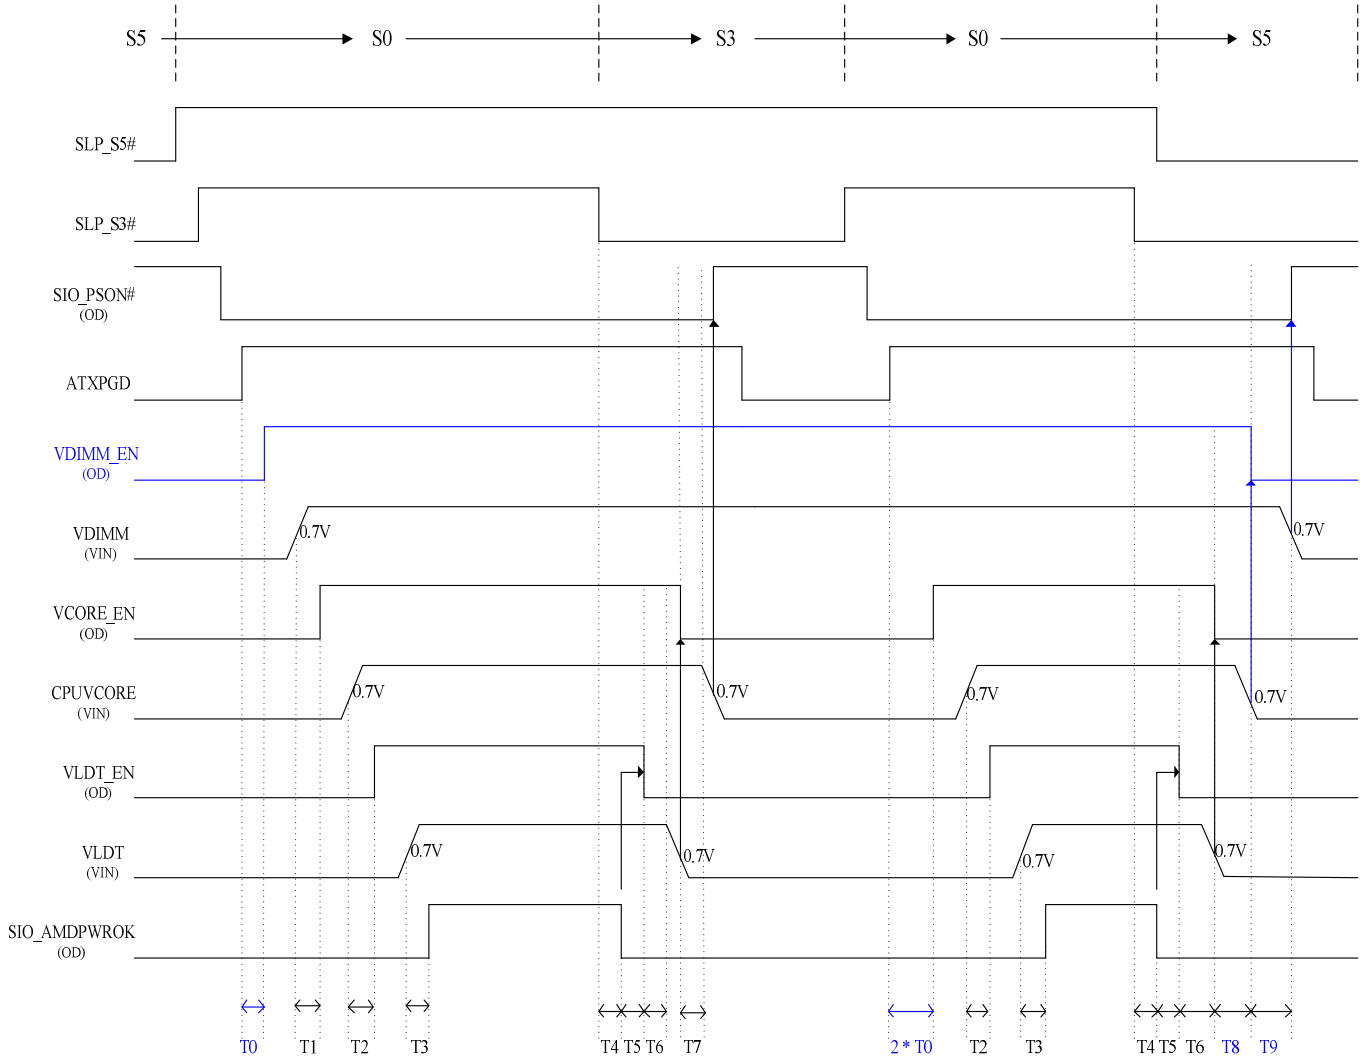

Figure 5-12 level detect

When S0->S3 or S0->S5, we support two kinds of power off sequence. One is non_level detect: it means VCORE_EN will pull low as long as about 10~15ms after VLDT_EN pull low and PSON will pull high as long as about 10~15ms after VCORE_EN pull low. Two, level detect, means VCORE_EN will pull low depend on delay time and pre-power group VLDT_IN, and PSON will pull high depend on pre-power group (VDIMM_IN, ATXPGD), too. User can set LDA CRF7[0] to choose two condition and its default is “0” (level detect).

Timing Parameters

Parameter	Description	Min.	Typ.	Max.	Unit
T0	Period of ATXPGD rises to 0.7V to VDIMM_EN assertion	10		15	ms
T1	Period of VDIMM rises to 0.7V to VCORE_EN assertion	10		15	ms
T2	Period of CPUVCORE rises to 0.7V to VLDT_EN assertion	10		15	ms
T3	Period of VLDT rises to 0.7V to AMD_PWROK assertion	10		15	ms
T4	Period of SLP_S3# deassertion to AMD_PWROK deassertion	10		50	ms
T5	Period of AMD_PWROK deassertion to VLDT_EN deassertion	10		15	ms
T6	Period of VLDT_EN deassertion to VCORE_EN deassertion	10		15	ms
T7	Period of VCORE_EN deassertion to PSON# deassertion	10		15	ms
T8	Period of VCORE_EN deassertion to VDIMM_EN deassertion	10		15	ms
T9	Period of VDIMM_EN deassertion to PSON# deassertion	10		15	ms

VDDA: 2.5V (not controlled by SIO)
VDIMM: DDR 1.8V, DDR3 1.5V (not controlled by SIO)
VLDT: 1.2V
VCORE: 0.8V ~ 1.55V

To support AMD power on sequence，we add some Pinout as VLDT_EN ，VCORE_EN，VLDT，VDIMM。The sequence is follow the figure above。CPU and NB must conform to the SPEC or else the SIO will suspend at the sequence。

5.7 Power Fault

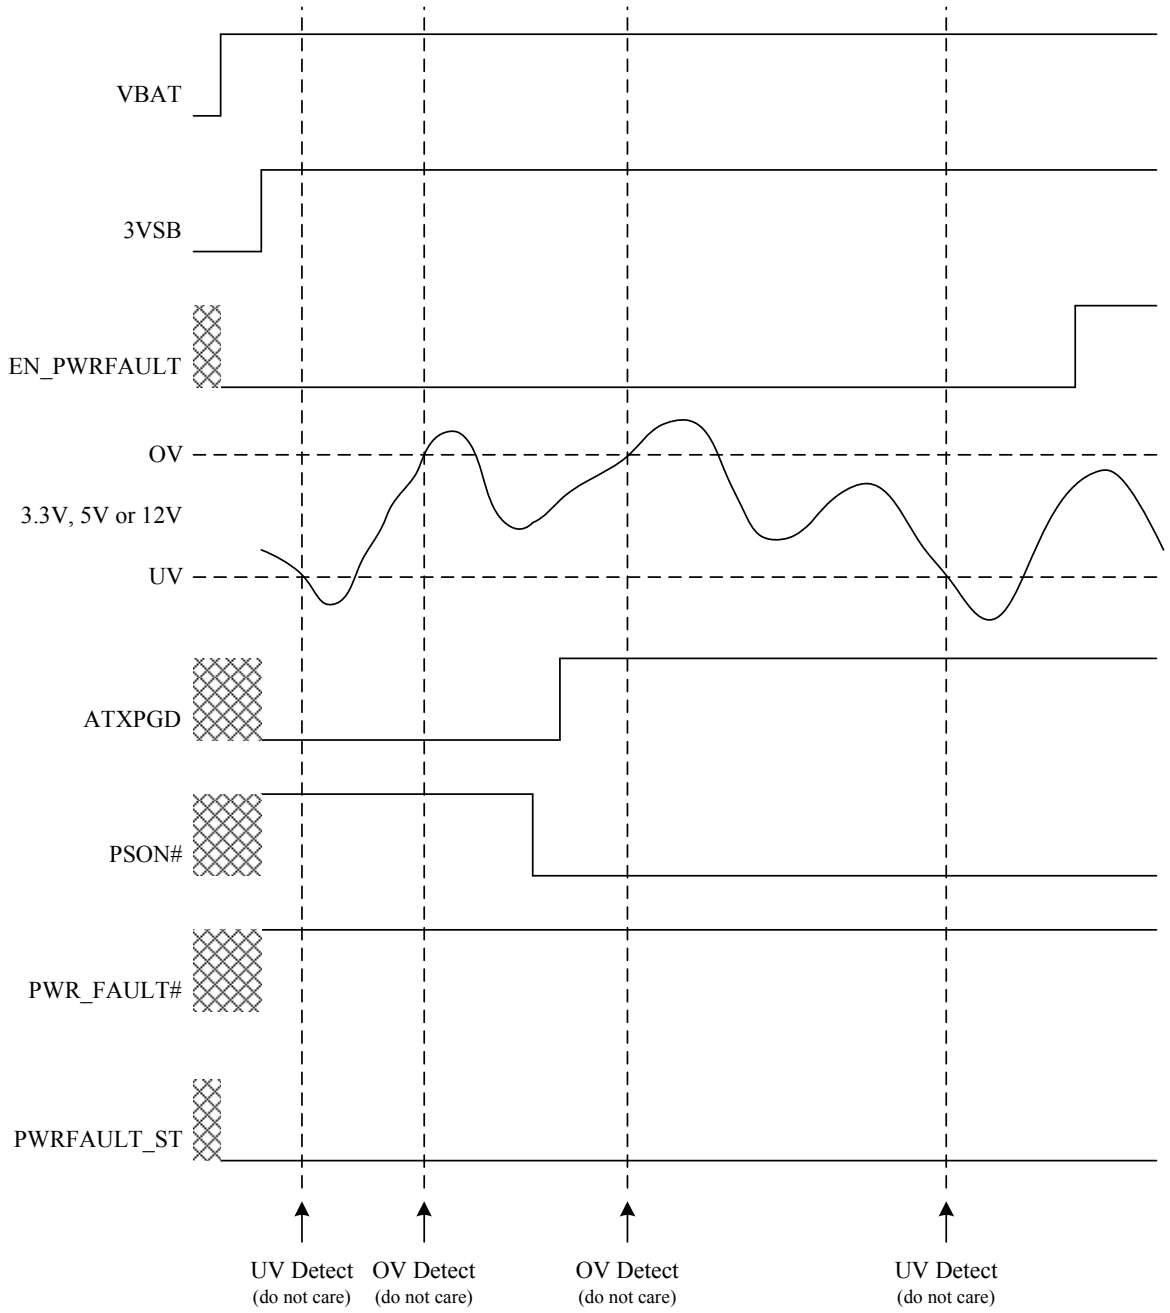

Figure 5-13 Power Fault (EN_PWRFAULT=0)

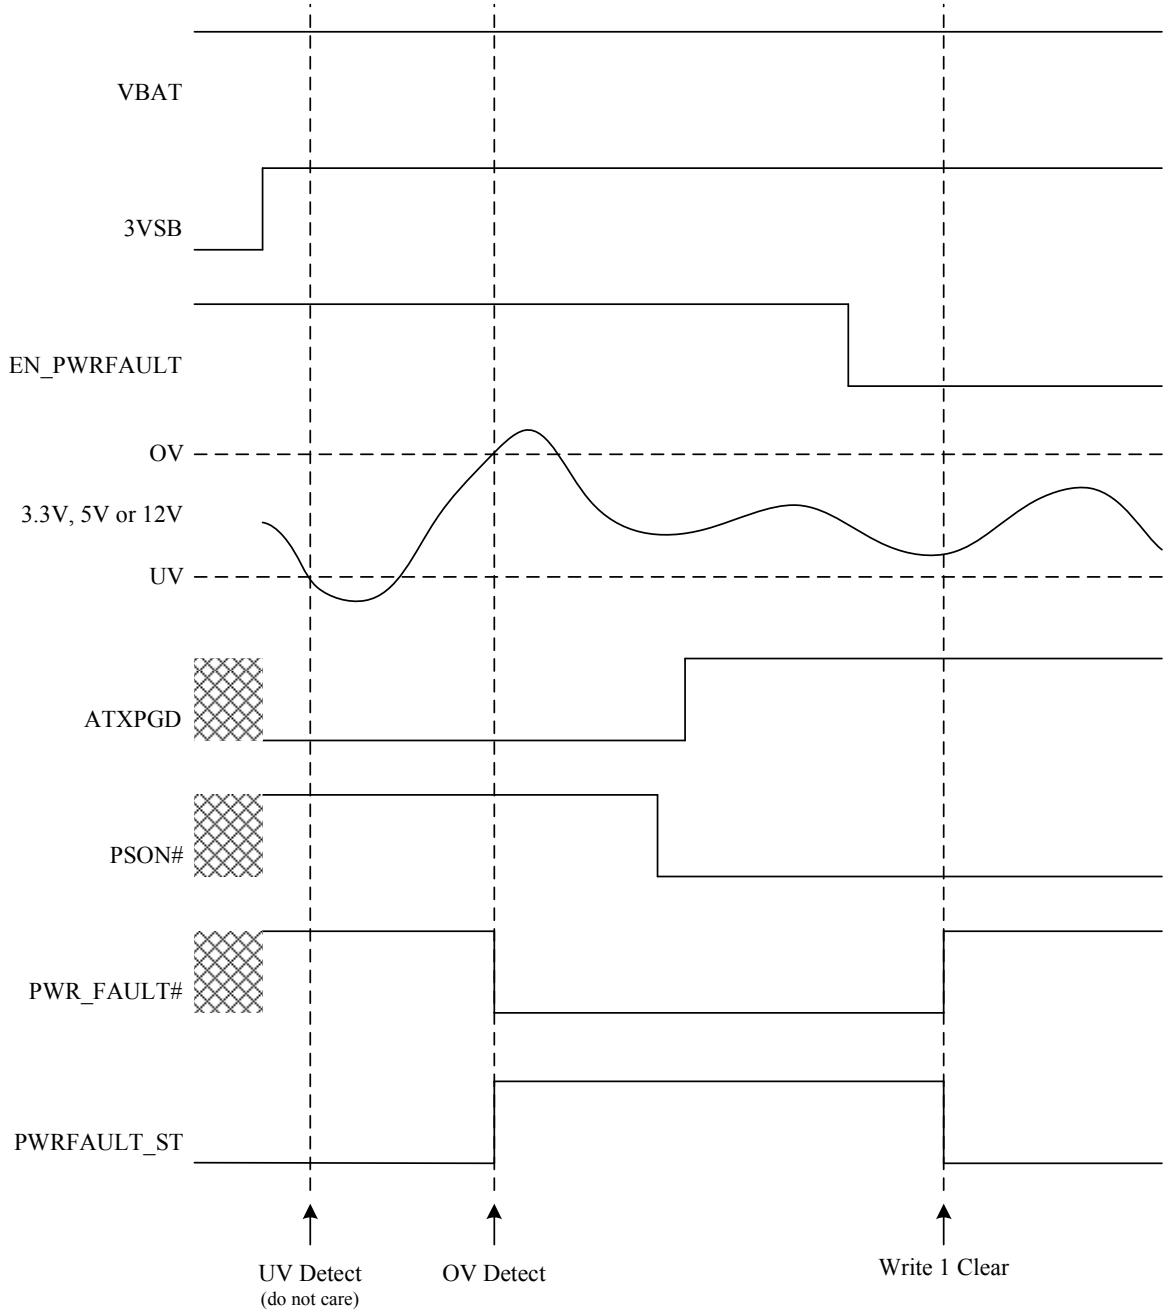

Figure 5-14 Power Fault (EN_PWRFAULT=1, ATXPGD=0, OV Detect)

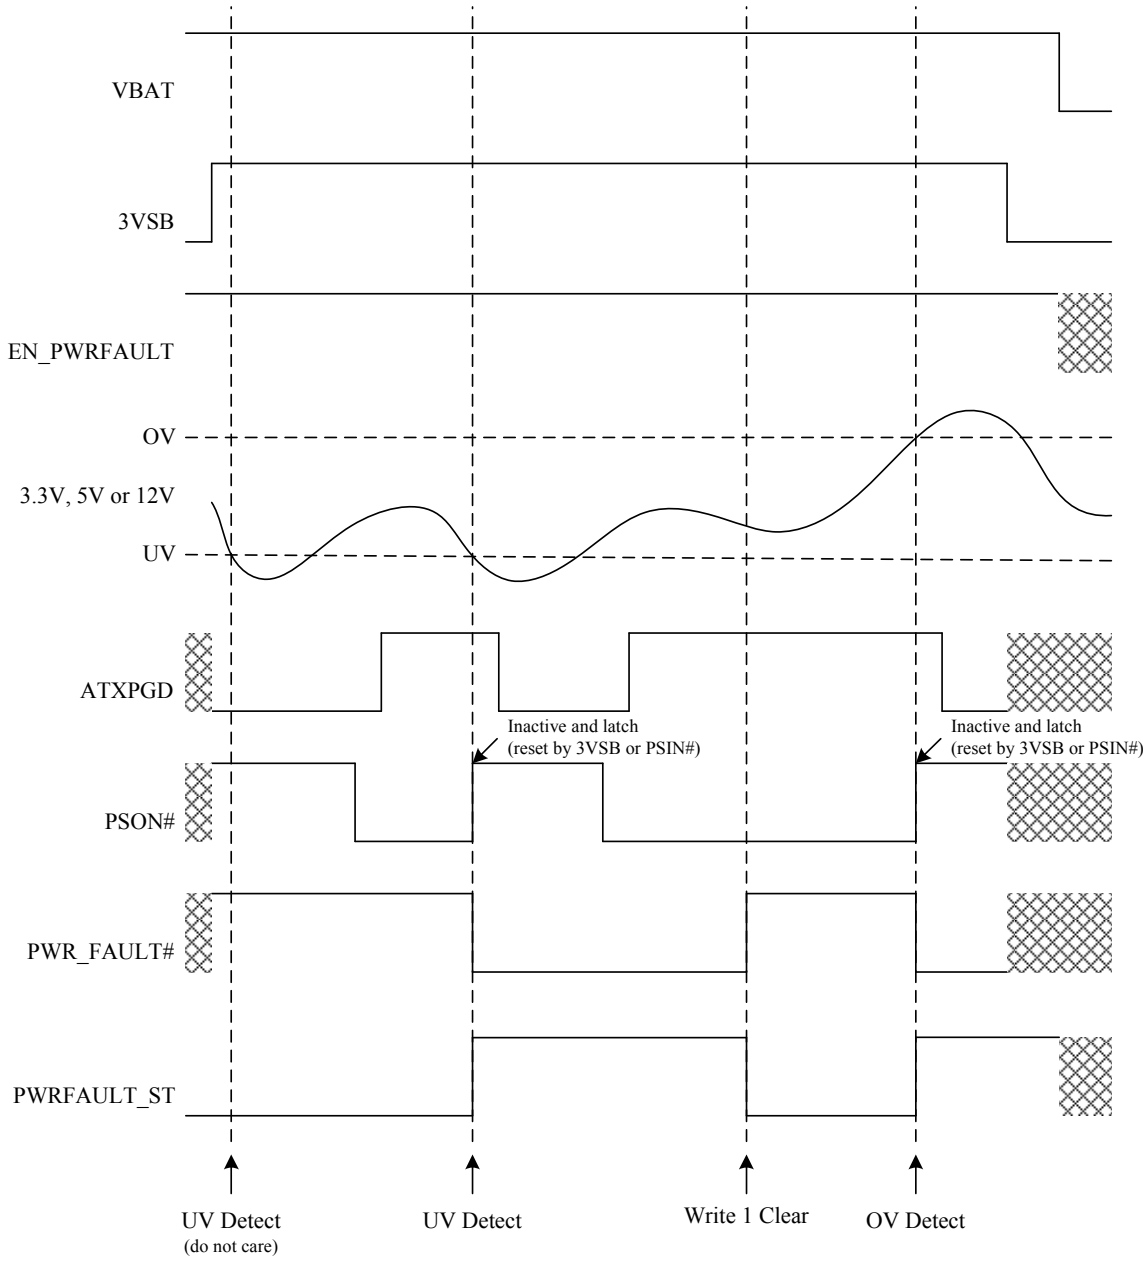

Figure 5-15 Power Fault (EN_PWRFAULT=1, ATXPGD=1, OV/UV Detect)

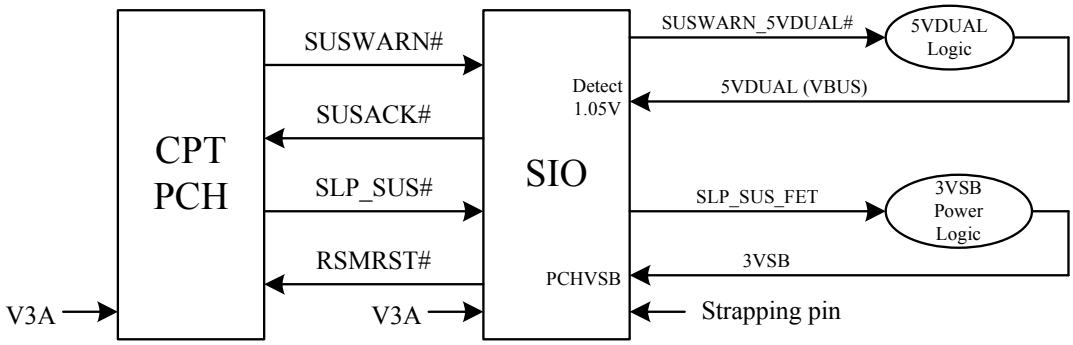
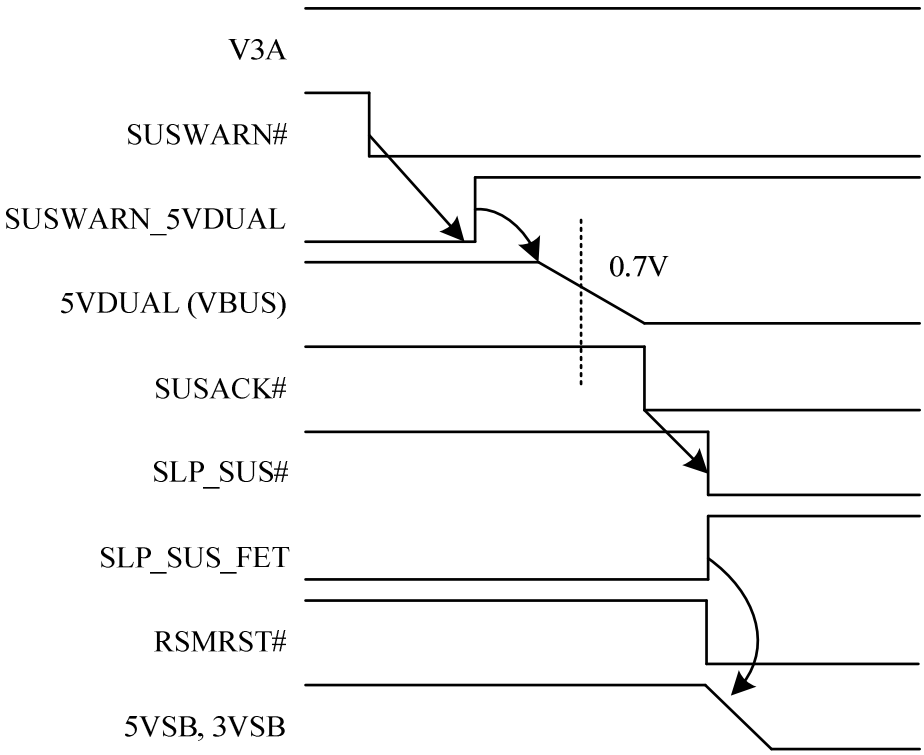
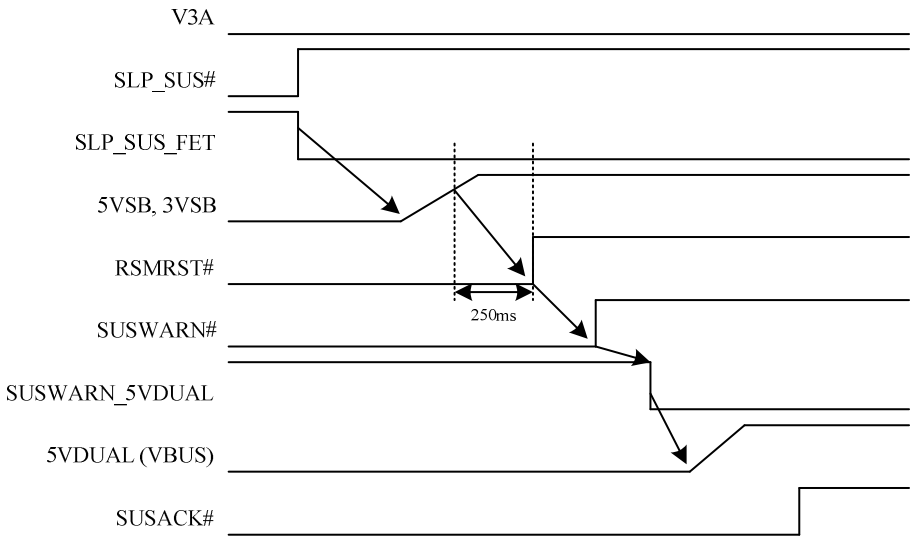
5.8 Fail-safe Intel DSW Function



5.8.1 Enter DSW State timing diagram

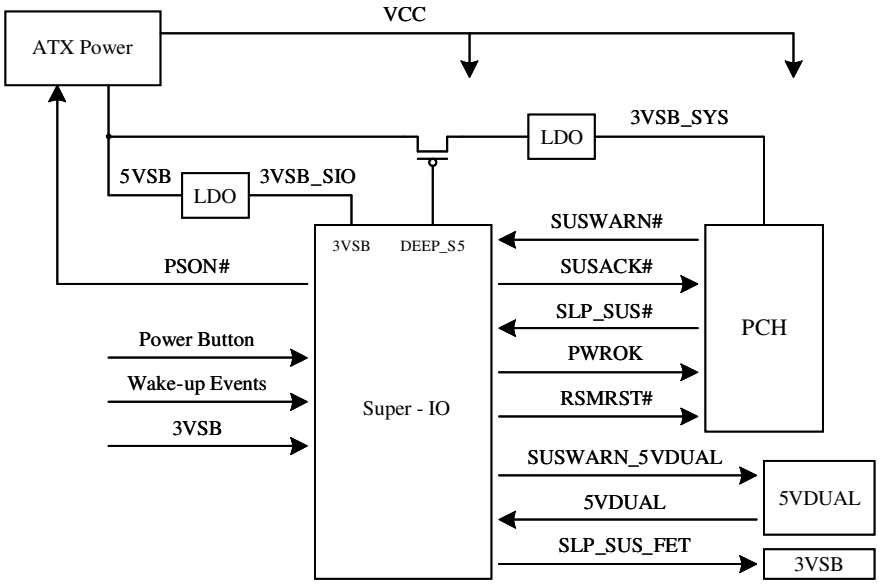


5.8.2 Exit DSW State timing diagram



5.8.3 Application Circuit

The NCT6683D can not only provide SIO Deep S5/S3 function, but Intel DSW function. The application circuit should follow the guide below:



6. CONFIGURATION REGISTER ACCESS PROTOCOL

NCT6683D-LU uses a special protocol to access configuration registers to set up different types of configurations. NCT6683D-LU has a total of sixteen Logical Devices (from Logical Device 0 to Logical Device F with the exception of Logical Device 0, 4 and F for backward compatibility) corresponding to ten individual functions: Parallel Port (Logical Device 1), UART A (Logical Device 2), UARTB (Logical Device 3), Keyboard Controller (Logical Device 5), Consumer Infrared Remote (Logical Device 6), GPIO0~GPIO7 (Logical Device 7), PORT80 UART (Logical Device 8), GPIO8~9, GPIO0 Enhance, GPIO1 Enhance (Logical Device 9), ACPI (Logical Device A), EC Space (Logical Device B), RTC Timer (Logical Device C), Deep Sleep (Logical Device D), Fan Assign (Logical Device E).

It would require a large address space to access all of the logical device configuration registers if they were mapped into the normal PC address space. NCT6683D-LU, then, maps the entire configuration registers through two I/O addresses (2Eh/2Fh or 4Eh/4Fh) set by configuration register. The two I/O addresses act as an index/data pair to read or write data to the Super I/O. One must write an index to the first I/O address which points to the register and read or write to the second address which acts as a data register.

An extra level of security is added by only allowing data updates when the Super I/O is in a special mode, called the Extended Function Mode. This mode is entered by two successive writes of 87h data to the first I/O address. This special mode ensures no false data can corrupt the Super I/O configuration during a program runaway.

There are a set of global registers located at index 0h – 2Fh, containing information and configuration for the entire chip.

The method to access the control registers of the individual logical devices is straightforward. Simply write the desired logical device number into the global register 07h. Subsequent accesses with indexes of 30h or higher are directly to the logical device registers.

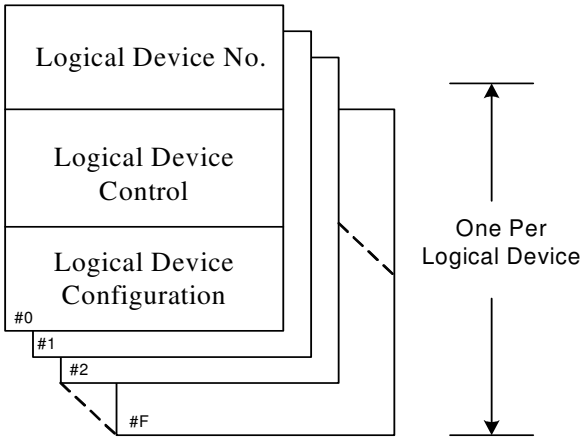


Figure **6-1** Structure of the Configuration Register

Table **6-1** Devices of I/O Base Address

LOGICAL DEVICE NUMBER	FUNCTION	I/O BASE ADDRESS
0	Reserved	
1	Parallel Port	100h ~ FF8h
2	UARTA	100h ~ FF8h
3	UARTB	100h ~ FF8h
4	Reserved	
5	Keyboard Controller	100h ~ FFFh
6	CIR	100h ~ FF8h
7	GPIO0~GPIO7	Reserved
8	PORT80 UART	Reserved
9	GPIO8~9, GPIO0 Enhance, GPIO1 Enhance	Reserved
A	ACPI	Reserved
B	EC Space (includes functions such as Hardware Monitor, CIR WAKE-UP, WDT, LED, ASF, PECI, TSI, SMBus Master, …)	100h ~ FF8h
C	RTC Timer	Reserved
D	Deep Sleep, Power Fault	Reserved
E	Fan Assign	Reserved
F	Reserved	

6.1 Configuration Sequence

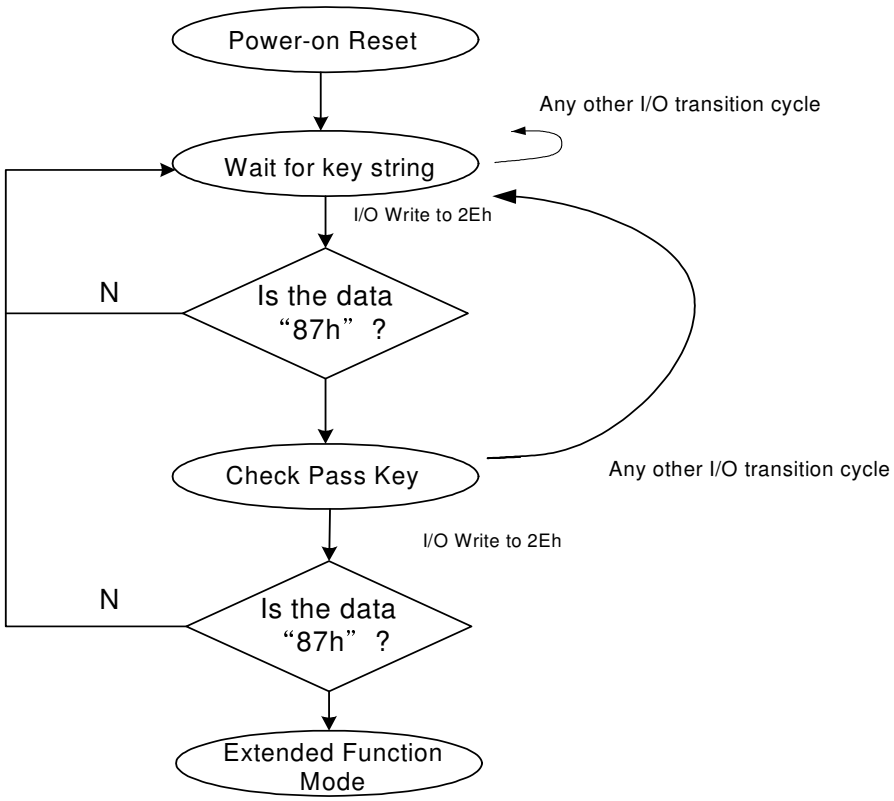

Figure **6-2** Configuration Register

To program NCT6683D-LU configuration registers, the following configuration procedures must be in the followed sequence:

(1). Enter the Extended Function Mode.

(2). Configure the configuration registers.

(3). Exit the Extended Function Mode.

6.1.1 Enter the Extended Function Mode

To place the chip into the Extended Function Mode, two successive writes of 0x87 must be applied to Extended Function Enable Registers (EFERs, i.e. 2Eh or 4Eh). Please see Global Register CR26 [Bit6].

6.1.2 Configure the Configuration Registers

The chip selects the Logical Device and activates the desired Logical Devices through Extended Function Index Register (EFIR) and Extended Function Data Register (EFDR). The EFIR is located at the same address as the EFER, and the EFDR is located at address (EFIR+1).

First, write the Logical Device Number (i.e. 0x07) to the EFIR and then write the number of the desired Logical Device to the EFDR. If accessing the Chip (Global) Control Registers, this step is not required.

Secondly, write the address of the desired configuration register within the Logical Device to the EFIR and then write (or read) the desired configuration register through the EFDR.

6.1.3 Exit the Extended Function Mode

To exit the Extended Function Mode, writing 0xAA to the EFER is required. Once the chip exits the Extended Function Mode, it is in the normal running mode and is ready to enter the configuration mode.

6.1.4 Software Programming Example

The following example is written in Intel 8086 assembly language. It assumes that the EFER is located at 2Eh, so the EFIR is located at 2Eh and the EFDR is located at 2Fh. If the HEFRAS (CR[26h] bit 6 showing the value of the strap pin at power on) is set, 2Eh can be directly replaced by 4Eh and 2Fh replaced by 4Fh.

This example programs the configuration register F0h (clock source) of logical device 1 (UART A) to the value of 3Ch (24MHz). First, one must enter the Extended Function Mode, then setting the Logical Device Number (Index 07h) to 01h. Then program index F0h to 3Ch. Finally, exit the Extended Function Mode.

```
;-----------------------------------------------------
; Enter the Extended Function Mode
;-----------------------------------------------------
MOV    DX, 2EH
MOV    AL, 87H
OUT    DX, AL
OUT    DX, AL
;-------------------------------------------------------------------------
; Configure Logical Device 1, Configuration Register CRF0
;-------------------------------------------------------------------------
MOV    DX, 2EH
MOV    AL, 07H
OUT    DX, AL          ; point to Logical Device Number Reg.
MOV    DX, 2FH
MOV    AL, 01H
OUT    DX, AL          ; select Logical Device 1
;
MOV    DX, 2EH
MOV    AL, F0H
OUT    DX, AL          ; select CRF0
MOV    DX, 2FH
MOV    AL, 3CH
OUT    DX, AL          ; update CRF0 with value 3CH
;-------------------------------------------------
; Exit the Extended Function Mode
;-------------------------------------------------
MOV    DX, 2EH
MOV    AL, AAH
OUT    DX, AL
```

7. EC SPACE

7.1 Features Implemented by Firmware

- ACPI power sequence controls and glue logics, such as RSMRST#, PSON#, PWROK, RSTOUT, PSIN#, PSOUT#, ATXPGD, SLP_S3#, SLP_S5#, …
  - --- Main Power good / power OK signals ATXPGD and internal power sensing.
  - --- Power distribution control (for switching between Main and Standby regulators)
  - --- Main power supply turn on (PSON#)
  - --- Resume reset (Master Reset) according to the stand-by 3V
  - --- Reset button de-bouncer
  - --- Power Good out mechanism using ATXPGD and internal power sensing
  - --- Buffers PCI_RESET to generate 3 reset output signals
- Power restoring policy when AC was recovered
- Advanced Deep Sleep Control logic to save more power during S3 / S5
  - --- Memory power switching support
  - --- Scheduling time slot to save more power when system sleeps
- Control logic to wake system up from normal / deep sleep state
- Advanced watch dog timers
- Hardware Monitoring (including voltage sources, analog / digital / virtual temperature sources, and tachometers)
- Customizable handling about SKTOCC#, CASEOPEN# signals
- Facilities for modern digital sensor interface, such as PECI 3.0, DIMM temperature pushing back, DIMM Ambient Temperature writing back, Sandy Bridge PCH, SMBus sensors, and automatic polling engines …
- Smart fan control algorithms such as Thermal Cruise, Speed Cruise, Smart Fan 3, Smart Fan 4, DTS1.0 and DTS2.0 Control, and Smart Tracking for both Duty/RPM control
- Front Panel Power LED with different blinking patterns and fading effect
- Port 80 Message Buffering with / without 7-segment LED driving
- Up to 5 CIR keys to wake up system from sleep state
- OEM SMBus Slave Interface to allow hardware control from SMBus master such as BMC
- …

7.2 EC Space Register Set

The EC Space accommodates several functions featured by firmware, such as health management related functions, watchdog timers, PECI / SMBus masters, ACPI controls…This space is accessible via LPC I/O transactions. The I/O space allocated for this module is system dependent. 8 IO ports should be allocated.

- There are two ports begin from this base address. The first port is for BIOS/ACPI accessing and the second port is for application software accessing. Each port has INDEX and PAGE register for DATA register indirect access. A protection lock was provided to make sure synchronous access on registers. If it is enabled by mcu, the two port's PAGE register can be written if its value or writing data is 0xFF ; INDEX register can be written if PAGE register is not 0xFF and its value or writing data is 0xFF.

7.2.1 Page Port0 – Base Address0 + 0

Default : -
Size: 8 bits

BIT	READ / WRITE	DESCRIPTION
7-0	R / W	Host Interface Event Register1

** : it was mapped to EC Space register at Page 0, Index 29h, HIF_EVENT1

7.3 Operations on EC Space

Please refer to NCT6683D-LU EC Space Specification for details

8. ANALOG INPUTS

NOTICE : Interface for voltage, temperature, and fan speed monitoring were implemented and extended by firmware. About detailed implementation and interface registers for various hardware status monitoring such as PECI, PCH …, please refer to NCT6683D Family EC Space Datasheet. Here only the base hardware and application circuit for analog voltage / temperature monitoring were introduced.

The analog inputs of the hardware monitor block connect to an 7-bit Analog to Digital Converter (ADC) and 4 internal signals connected to the power supplies (AVSB, VBAT, 3VSB and 3VCC, with gain stage to double voltage range detected. Reading values of them are manipulated to have same base unit, 16mV, by firmware). All inputs are limited to a maximum voltage of 2.048V due to an internal setting of 16mV LSB (128 steps x 16mV = 2.048V). All inputs to the ADC must limit the maximum voltage by using a voltage divider. The power supplies have internal resistors, while the external pins require outside limiting resistors as described below.

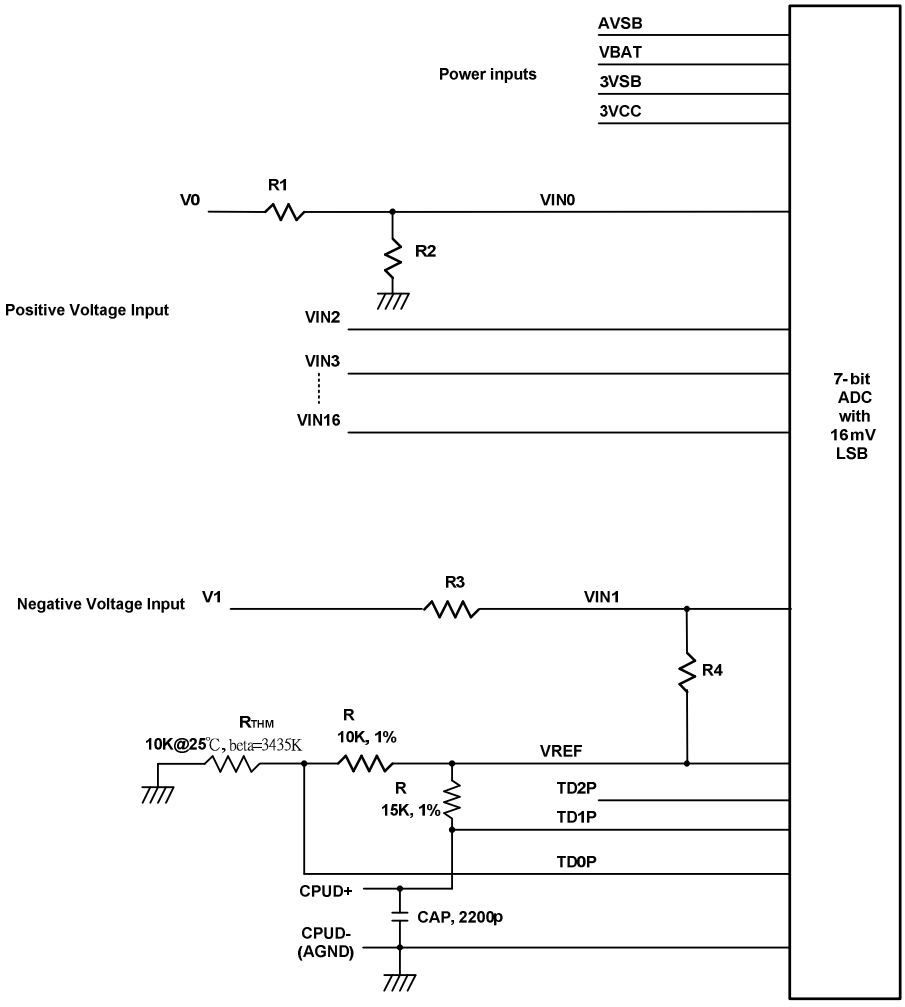

Figure **8-1** Analog Inputs and Application Circuit of the NCT6683D-LU

As illustrated in the figure above, other connections may require some external circuits. The rest of this section provides more information about voltages outside the range of the 7-bit ADC, CPU Vcore voltage detection, and temperature sensing.

8.1 Voltages Over 2.048 V or Less Than 0 V

Input voltages greater than 2.048 V should be reduced by an external resistor divider to keep the input voltages in the proper range. For example, input voltage V_0 (+12 V) should be reduced before it is connected to VIN0 according to the following equation:

$$VIN0 = V_0 \times \frac{R_2}{R_1 + R_2}$$

R1 and R2 can be set to 56 KΩ and 10 KΩ, respectively, to reduce V_0 from +12 V to less than 2.048 V.

All the internal inputs of the ADC, AVSB, VBAT, 3VSB and 3VCC utilize an integrated voltage divider with both resistors equal to 34KΩ, yielding a voltage one half of the power supply. Since one would expect a worst-case 10% variation or a 3.63V maximum voltage, the input to the ADC will be 1.815V, well within the maximum range.

$$V_{in} = VCC \times \frac{34K\Omega}{34K\Omega + 34K\Omega} \cong 1.65V$$, where VCC is set to 3.3V

Negative voltages are handled similarly, though the equation looks a little more complicated. For example, negative voltage V1 (-12V) can be reduced according to the following equation:

$$VIN1 = (V_1 - 2.048) \times \frac{R_4}{R_3 + R_4} + 2.048, where V_1 = -12$$

R3 and R4 can be set to 232 KΩ and 10 KΩ, respectively, to reduce negative input voltage V_1 from –12 V to less than 2.048 V. Note that R4 is referenced to VREF, or 2.048V instead of 0V to allow for more dynamic range. This is simply good analog practice to yield the most precise measurements.

Both of these solutions are illustrated in the figure above.

8.2 Monitor Temperature from Thermistor

External thermistors should have a β value of 3435K and a resistance of 10 KΩ at 25°C. As illustrated in the schematic above, the thermistor is connected in series with a 10-KΩ resistor and then connects to VREF.

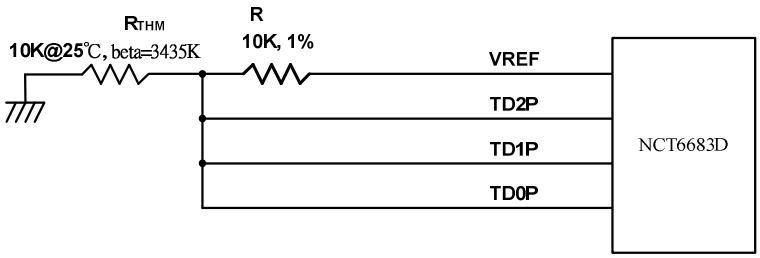

Figure **8-2** Monitoring Temperature from Thermistor

8.3 Monitor Temperature from Thermal Diode (Voltage Mode)

To monitor temperature of thermal diodes, the D- pins of thermal diodes are connected to AGND, and the D+ pins are connected to the temperature sensor pins (TD0P, TD1P, TD2P) of NCT6683D-LU. A 15-KΩ resistor is connected to VREF to supply the bias current for the diode, and a 2200-pF bypass capacitor is added to filter high-frequency noise.

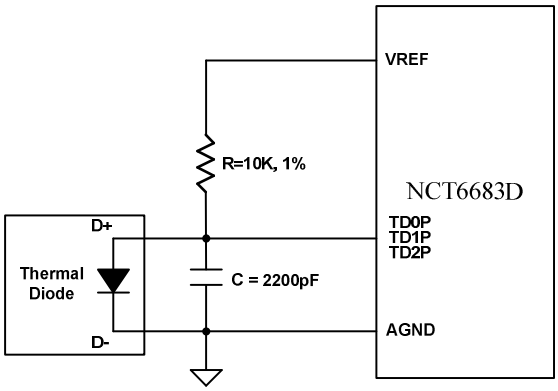

Figure **8-3** Monitoring Temperature from Thermal Diode (Voltage Mode)

8.4 Monitor Temperature from Thermal Diode (Current Mode)

NCT6683D-LU can also sense the diode temperature through Current Mode and the circuit is shown in the following figure.

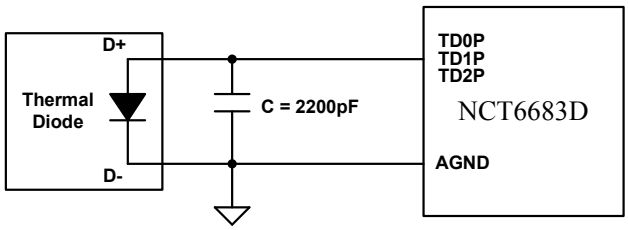

Figure 8-4 Monitoring Temperature from Thermal Diode (Current Mode)

To monitor temperature of thermal diodes through current mode operation, the D- pins of thermal diodes are connected to AGND and the D+ pins are connected to temperature sensor pins (TD0P, TD1P, TD2P) of NCT6683D-LU. A bypass capacitor with C=2200pF should be added to filter the high frequency noise.

9. UART PORT

9.1.1 UART Control Register (UCR) (Read/Write)

The UART Control Register defines and controls the protocol for asynchronous data communications, including data length, stop bit, parity, and baud rate selection.

BIT	7	6	5	4	3	2	1	0
NAME	BDLAB	SSE	PBFE	EPE	PBE	MSBE	DLS1	DLS0
DEFAULT	0	0	0	0	0	0	0	0

BIT	DESCRIPTION
7	**BDLAB (Baud Rate Divisor Latch Access Bit).** When this bit is set to logic 1, designers can access the divisor (in 16-bit binary format) from the divisor latches of the baud-rate generator during a read or write operation. When this bit is set to logic 0, the Receiver Buffer Register, the Transmitter Buffer Register, and the Interrupt Control Register can be accessed.
6	**SSE (Set Silence Enable).** A logic 1 forces the Serial Output (SOUT) to a silent state (a logical 0). Only IRTX is affected by this bit; the transmitter is not affected.
5	**PBFE (Parity Bit Fixed Enable).** When PBE and PBFE of UCR are both set to logic 1, (1) if EPE is logic 1, the parity bit is logical 0 when transmitting and checking; (2) if EPE is logic 0, the parity bit is logical 1 when transmitting and checking.
4	**EPE (Even Parity Enable).** When PBE is set to logic 1, this bit counts the number of logic 1's in the data word bits and determines the parity bit. When this bit is set to logic 1, the parity bit is set to logic 1 if an even number of logic 1's are sent or checked. When the bit is set to logic 0, the parity bit is logic 1, if an odd number of logic 1's are sent or checked.
3	**PBE (Parity Bit Enable).** When this bit is set to logic 1, the transmitter inserts a stop bit between the last data bit and the stop bit of the SOUT, and the receiver checks the parity bit in the same position.
2	**MSBE (Multiple Stop Bit Enable).** Defines the number of stop bits in each serial character that is transmitted or received. (1) If MSBE is set to logic 0, one stop bit is sent and checked. (2) If MSBE is set to logic 1 and the data length is 5 bits, one-and-a-half stop bits are sent and checked. (3) If MSBE is set to logic 1 and the data length is 6, 7, or 8 bits, two stop bits are sent and checked.
1	**DLS1 (Data Length Select Bit 1).** Defines the number of data bits that are sent or checked in each serial character.
0	**DLS0 (Data Length Select Bit 0).** Defines the number of data bits that are sent or checked in each serial character.

DLS1	DLS0	DATA LENGTH
0	0	5 bits
0	1	6 bits
1	0	7 bits

DLS1	DLS0	DATA LENGTH
1	1	8 bits

The following table identifies the remaining UART registers. Each one is described separately in the following sections.

Table 9-1 Register Summary for UART

Bit Number

+ 7	User Defined Register	UDR	Bit 0	Bit 1	Bit 2	Bit 3	Bit 4	Bit 5	Bit 6	Bit 7
+ 0 BDLAB = 1	Baudrate Divisor Latch Low	BLL	Bit 0	Bit 1	Bit 2	Bit 3	Bit 4	Bit 5	Bit 6	Bit 7
+ 1 BDLAB = 1	Baudrate Divisor Latch High	BHL	Bit 8	Bit 9	Bit 10	Bit 11	Bit 12	Bit 13	Bit 14	Bit 15

*: Bit 0 is the least significant bit. The least significant bit is the first bit serially transmitted or received.
**: These bits are always 0 in 16450 Mode.

9.1.2 UART Status Register (USR) (Read/Write)

This 8-bit register provides information about the status of data transfer during communication.

BIT	7	6	5	4	3	2	1	0
NAME	RF EI	TSRE	TBRE	SBD	NSER	PBER	OER	RDR
DEFAULT	0	1	1	0	0	0	0	0

BIT	DESCRIPTION
7	**RF EI (RX FIFO Error Indication).** In 16450 mode, this bit is always set to logical 0. in 16550 mode, this bit is set to logical 1 when there is at least one parity-bit error and no stop0bit error or silent-byte detected in the FIFO. In 16550 mode, this bit is cleared to logical 0 by reading from the USR if there are no remaining errors left in the FIFO.
6	**TSRE (Transmitter Shift Register Empty).** In 16450 mode, this bit is set to logical 1 when TBR and TSR are both empty. In 16550 mode, it is set to logical 1 when the transmit FIFO and TSR are both empty. Otherwise, this bit is set to logical 0.
5	**TBRE (Transmitter Buffer Register Empty).** In 16450 mode, when a data character is transferred from TBR to TSR, this bit is set to logical 1. If ETREI of ICR is high, and interrupt is generated to notify the CPU to write next data. In 16550 mode, this bit is set to logical 1 when the transmit FIFO is empty. It is set to logical 0 when the CPU writes data into TBR or the FIFO.
4	**SBD (Silent Byte Detected).** This bit is set to logical 1 to indicate that received data are kept in silent state for the time it takes to receive a full word, which includes the start bit, data bits, parity bit, and stop bits. In 16550 mode, it indicates the same condition for the data on the top of the FIFO. When the CPU reads USR, it sets this bit to logical 0.
3	**NSER (No Stop Bit Error).** This bit is set to logical 1 to indicate that the received data have no stop bit. In 16550 mode, it indicates the same condition for the data on the top of the FIFO. When the CPU reads USR, it sets this bit to logical 0.
2	**PBER (Parity Bit Error).** This bit is set to logical 1 to indicate that the received data has the wrong parity bit. In 16550 mode, it indicates the same condition for the data on the top of the FIFO. When the CPU reads USR, it sets this bit to logical 0.
1	**OER (Overrun Error).** This bit is set to logical 1 to indicate that the received data have been overwritten by the next received data before they were read by the CPU. In 16550 mode, it indicates the same condition, instead of FIFO full. When the CPU reads USR, it sets this bit to logical 0.
0	**RDR (RBR Data Ready).** This bit is set to logical 1 to indicate that the received data are ready to be read by the CPU in the RBR or FIFO. When no data are left in the RBR or FIFO, the bit is set to logical 0.

9.1.3 Handshake Control Register (HCR) (Read/Write)

This register controls pins used with handshaking peripherals such as modems and also controls the diagnostic mode of the UART.

BIT	7	6	5	4	3	2	1	0
NAME	RESERVED			INTERNAL LOOPBACK ENABLE	IRQ ENABLE	LOOPBACK RI INPUT	RTS	DTR
DEFAULT	0	0	0	0	0	0	0	0

BIT	DESCRIPTION
7-5	**Reserved.**
4	**Internal Loopback Enable.** When this bit is set to logic 1, the UART enters diagnostic

	mode, as follows: (1) SOUT is forced to logic 1, and SIN is isolated from the communication link. (2) The modem output pins are set to their inactive state. (3) The modem input pins are isolated from the communication link and connect internally as DTR (bit 0 of HCR) →DSR#, RTS (bit 1 of HCR) →CTS#, Loopback RI input (bit 2 of HCR) → RI# and IRQ enable (bit 3 of HCR) →DCD#. Aside from the above connections, the UART operates normally. This method allows the CPU to test the UART in a convenient way.
3	**IRQ Enable.** The UART interrupt output is enabled by setting this bit to logic 1. In diagnostic mode, this bit is internally connected to the modem control input DCD#.
2	**Loopback RI Input.** This bit is only used in the diagnostic mode. In diagnostic mode, this bit is internally connected to the modem control input RI#.
1	**RTS (Request to Send).** This bit controls the RTS# output. The value of this bit is inverted and output to RTS#.
0	**DTR (Data Terminal Ready).** This bit controls the DTR# output. The value of this bit is inverted and output to DTR#.

9.1.4 Handshake Status Register (HSR) (Read/Write)

This register reflects the current state of four input pins used with handshake peripherals such as modems and records changes on these pins.

BIT	7	6	5	4	3	2	1	0
NAME	DCD	RI	DSR	CTS	TDCD	FERI	TDSR	TCTS
DEFAULT	NA	NA	NA	NA	NA	NA	NA	NA

BIT	DESCRIPTION
7	**DCD (Data Carrier Detect).** This bit is the inverse of the DCD# input and is equivalent to bit 3 of HCR in Loopback mode.
6	**RI (Ring Indicator).** This bit is the inverse of the RI# input and is equivalent to bit 2 of HCR in Loopback mode.
5	**DSR (Data Set Ready).** This bit is the inverse of the DSR# input and is equivalent to bit 0 of HCR in Loopback mode.
4	**CTS (Clear to Send).** This bit is the inverse of the CTS# input and is equivalent to bit 1 of HCR in Loopback mode.
3	**TDCD (DCD# Toggling).** This bit indicates that the state of the DCD# pin has changed after HSR is read by the CPU.
2	**FERI (RI Falling Edge).** This bit indicates that the RI# pin has changed from low to high after HSR is read by the CPU.
1	**TDSR (DSR# Toggling).** This bit indicates that the state of the DSR# pin has changed after HSR is read by the CPU.
0	**TCTS (CTS# Toggling).** This bit indicates that the state of the CTS# pin has changed after HSR is read by the CPU.

9.1.5 UART FIFO Control Register (UFR) (Write only)

This register is used to control the FIFO functions of the UART.

BIT	7	6	5	4	3	2	1	0
NAME	MSB	LSB	RESERVED		DMA MODE SELECT	TRANSMITTER FIFO RESET	RECEIVER FIFO RESET	FIFO ENABLE
DEFAULT	0	0	NA	NA	0	0	0	0

BIT	DESCRIPTION	
7	**MSB (RX Interrupt Active Level).**	These two bits are used to set the active level of the receiver FIFO interrupt. The active level is the number of bytes that must be in the receiver FIFO to generate an interrupt.
6	**LSB (RX Interrupt Active Level).**	
5-4	**RESERVED.**	
3	**DMS MODE SELECT.** When this bit is set to logic 1, DMA mode changes from mode 0 to mode 1 if UFR bit 0 = 1.	
2	**TRANSMITTER FIFO RESET.** Setting this bit to logic 1 resets the TX FIFO counter logic to its initial state. This bit is automatically cleared afterwards.	
1	**RECEIVER FIFO RESET.** Setting this bit to logic 1 resets the RX FIFO counter logic to its initial state. This bit is automatically cleared afterwards.	
0	**FIFO ENABLE.** This bit enables 16550 (FIFO) mode. This bit should be set to logic 1 before other UFR bits are programmed.	

BIT 7	BIT 6	RX FIFO INTERRUPT ACTIVE LEVEL (BYTES)
0	0	01
0	1	04
1	0	08
1	1	14

9.1.6 Interrupt Status Register (ISR) (Read only)

This register reflects the UART interrupt status.

BIT	7	6	5	4	3	2	1	0
NAME	FIFOS ENABLED		RESERVED		INTERRUPT STATUS BIT 2	INTERRUPT STATUS BIT 1	INTERRUPT STATUS BIT 0	0 IF INTERRUPT PENDING
DEFAULT	0	0	0	0	0	0	0	1

BIT	DESCRIPTION
7-6	**FIFOS ENABLED.** Set to logical 1 when UFR, bit 0 = 1.
5-4	**RESERVED.**
3	**INTERRUPT STATUS BIT 2.** In 16450 mode, this bit is logical 0. In 16550 mode, bits 3 and 2 are set to logical 1 when a time-out interrupt is pending. Please see the table

	below.	
2	**INTERRUPT STATUS BIT 1.**	These two bits identify the priority level of the pending interrupt, as shown in the table below.
1	**INTERRUPT STATUS BIT 0.**	
0	**0 IF INTERRUPT PENDING.** This bit is logic 1 if there is no interrupt pending. If one of the interrupt sources has occurred, this bit is set to logical 0.	

ISR				INTERRUPT SET AND FUNCTION			
Bit 3	Bit 2	Bit 1	Bit 0	Interrupt priority	Interrupt Type	Interrupt Source	Clear Interrupt
0	0	0	1	-	-	No Interrupt pending	-
0	1	1	0	First	UART Receive Status	1. OER = 1 2. PBER =1 3. NSER = 1 4. SBD = 1	Read USR
0	1	0	0	Second	RBR Data Ready	1. RBR data ready 2. FIFO interrupt active level reached	1. Read RBR 2. Read RBR until FIFO data under active level
1	1	0	0	Second	FIFO Data Timeout	Data present in RX FIFO for 4 characters period of time since last access of RX FIFO.	Read RBR
0	0	1	0	Third	TBR Empty	TBR empty	1. Write data into TBR 2. Read ISR (if priority is third)
0	0	0	0	Fourth	Handshake status	1. TCTS = 1 2. TDSR = 1 3. FERI = 1 4. TDCD = 1	Read HSR

** Bit 3 of ISR is enabled when bit 0 of UFR is logical 1.

9.1.7 Interrupt Control Register (ICR) (Read/Write)

This 8-bit register enables and disables the five types of controller interrupts separately. A selected interrupt can be enabled by setting the appropriate bit to logical 1. The interrupt system can be totally disabled by setting bits 0 through 3 to logical 0.

BIT	7	6	5	4	3	2	1	0
NAME	RESERVED				EHSRI	EUSRI	ETBREI	ERDRI
DEFAULT	0	0	0	0	0	0	0	0

BIT	DESCRIPTION
7-4	**RESERVED.**
3	**EHSRI (Handshake Status Interrupt Enable).** Set this bit to logical 1 to enable the handshake status register interrupt.
2	**EUSRI (UART Receive Status Interrupt Enable).** Set this bit to logical 1 to enable the UART status register interrupt.
1	**ETBREI (TBR Empty Interrupt Enable).** Set this bit to logical 1 to enable the TBR empty interrupt.
0	**ERDRI (RBR Data Ready Interrupt Enable).** Set this bit to logical 1 to enable the RBR data ready interrupt.

9.1.8 Programmable Baud Generator (BLL/BHL) (Read/Write)

Two 8-bit registers, BLL and BHL, compose a programmable baud generator that uses 24 MHz to generate a 1.8461 MHz frequency and divide it by a divisor from 1 to (2^{16} –1). The output frequency of the baud generator is the baud rate multiplied by 16, and this is the base frequency for the transmitter and receiver. The table below illustrates the use of the baud generator with a frequency of 1.8461 MHz. In high-speed UART mode (CR0C, bits 7 and 6), the programmable baud generator directly uses 24 MHz and the same divisor as the normal speed divisor. As a result, in high-speed mode, the data transmission rate can be as high as 1.5M bps.

BAUD RATE FROM DIFFERENT PRE-DIVIDER				
PRE-DIV: 13 1.8461M HZ	**PRE-DIV:1.625 14.769M HZ**	**PRE-DIV: 1.0 24M HZ**	**DECIMAL DIVISOR USED TO GENERATE 16X CLOCK**	**ERROR PERCENTAGE**
50	400	650	2304	**
75	600	975	1536	**
110	880	1430	1047	0.18%
134.5	1076	1478.5	857	0.099%
150	1200	1950	768	**
300	2400	3900	384	**
600	4800	7800	192	**
1200	9600	15600	96	**
1800	14400	23400	64	**
2000	16000	26000	58	0.53%
2400	19200	31200	48	**
3600	28800	46800	32	**
4800	38400	62400	24	**
7200	57600	93600	16	**
9600	76800	124800	12	**
19200	153600	249600	6	**
38400	307200	499200	3	**
57600	460800	748800	2	**
115200	921600	1497600	1	**

** Unless specified, the error percentage for all of the baud rates is 0.16%.

Note: Pre-Divisor is determined by CRF0 of UART A and B.

9.1.9 User-defined Register (UDR) (Read/Write)

This is a temporary register that can be accessed and defined by the user.

10. PARALLEL PORT

10.1 Printer Interface Logic

The NCT6683D-LU parallel port can be attached to devices that accept eight bits of parallel data at standard TTL level. The NCT6683D-LU supports the IBM XT/AT compatible parallel port (SPP), the bi-directional parallel port (BPP), the Enhanced Parallel Port (EPP), and the Extended Capabilities Parallel Port (ECP).

The following tables show the pin definitions for different modes of the parallel port.

Table 10-1 Pin Descriptions for SPP, EPP, and ECP Modes

HOST CONNECTOR	PIN ATTRIBUTE	SPP	EPP	ECP
1	O	Nstb	nWrite	nSTB, HostClk[2]
2-9	I/O	PD<7:0>	PD<7:0>	PD<7:0>
10	I	nACK	Intr	nACK, PeriphClk[2]
11	I	BUSY	nWait	BUSY, PeriphAck[2]
12	I	PE	PE	PEerror, nAckReverse[2]
13	I	SLCT	Select	SLCT, Xflag[2]
14	O	Nafd	nDStrb	nAFD, HostAck[2]
15	I	nERR	nError	nFault[1], nPeriphRequest[2]
16	O	Ninit	nInit	nINIT[1], nReverseRqst[2]
17	O	nSLIN	nAStrb	nSLIN[1], ECPMode[2]

Notes:
n<name > : Active Low
1. Compatible Mode
2. High Speed Mode
3. For more information, please refer to the IEEE 1284 standard.

HOST CONNECTOR	PIN ATTRIBUTE	SPP
1	O	nSTB
2	I/O	PD0
3	I/O	PD1
4	I/O	PD2
5	I/O	PD3
6	I/O	PD4
7	I/O	PD5
8	I/O	PD6
9	I/O	PD7
10	I	nACK
11	I	BUSY
12	I	PE
13	I	SLCT
14	O	nAFD
15	I	nERR
16	O	nINIT

HOST CONNECTOR	PIN ATTRIBUTE	SPP
17	O	nSLIN

10.2 Enhanced Parallel Port (EPP)

The following table lists the registers used in the EPP mode and identifies the bit map of the parallel port and EPP registers. Some of the registers are used in other modes as well.

Table 10-2 EPP Register Addresses

A2	A1	A0	REGISTER	NOTE
0	0	0	Data pot (R/W)	1
0	0	1	Printer status buffer (Read)	1
0	1	0	Printer control latch (Write)	1
0	1	0	Printer control swapper (Read)	1
0	1	1	EPP address port (R/W)	2
1	0	0	EPP data port 0 (R/W)	2
1	0	1	EPP data port 1 (R/W)	2
1	1	0	EPP data port 2 (R/W)	2
1	1	1	EPP data port 2 (R/W)	2

Notes:

1. These registers are available in all modes.
2. These registers are available only in EPP mode.

Table 10-3 Address and Bit Map for SPP and EPP Modes

REGISTER	7	6	5	4	3	2	1	0
Data Port (R/W)	PD7	PD6	PD5	PD4	PD3	PD2	PD1	PD0
Status Buffer (Read)	BUSY#	ACK#	PE	SLCT	ERROR#	1	1	TMOUT
Control Swapper (Read)	1	1	1	IRQEN	SLIN	INIT#	AUTOFD#	STROBE#
Control Latch (Write)	1	1	DIR	IRQ	SLIN	INIT#	AUTOFD#	STROBE#
EPP Address Port (R/W)	PD7	PD6	PD5	PD4	PD3	PD2	PD1	PD0
EPP Data Port 0 (R/W)	PD7	PD6	PD5	PD4	PD3	PD2	PD1	PD0
EPP Data Port 1 (R/W)	PD7	PD6	PD5	PD4	PD3	PD2	PD1	PD0
EPP Data Port 2 (R/W)	PD7	PD6	PD5	PD4	PD3	PD2	PD1	PD0
EPP Data Port 3 (R/W)	PD7	PD6	PD5	PD4	PD3	PD2	PD1	PD0

Each register (or pair of registers, in some cases) is discussed below.

10.2.1 Data Port (Data Swapper)

The CPU reads the contents of the printer's data latch by reading the data port.

10.2.2 Printer Status Buffer

The CPU reads the printer status by reading the printer status buffer. The bit definitions are as follows:

BIT	7	6	5	4	3	2	1	0
NAME	BUSY#	ACK#	PE	SLCT	ERROR#	RESERVED		TMOUT
DEFAULT	NA	NA	NA	NA	NA	1	1	0

BIT	DESCRIPTION
7	**BUSY#.** This signal is active during data entry, when the printer is off-line during printing, when the print head is changing position, or during an error state. When this signal is active, the printer is busy and cannot accept data.
6	**ACK#.** This bit represents the current state of the printer's ACK# signal. A logical 0 means the printer has received a character and is ready to accept another. Normally, this signal is active for approximately 5 μs before BUSY# stops.
5	**PE.** A logical 1 means the printer has detected the end of paper.
4	**SLCT.** A logical 1 means the printer is selected.
3	**ERROR#.** A logical 0 means the printer has encountered an error condition.
2-1	**RESERVED.**
0	**TMOUT.** This bit is only valid in EPP mode. A logical 1 indicates that a 10-μs time-out has occurred on the EPP bus; a logical 0 means hat no time-out error has occurred. Writing a logical 1 to this bit clears the time-out status bit; writing a logical 0 has no effect.

10.2.3 Printer Control Latch and Printer Control Swapper

The CPU reads the contents of the printer control latch by reading the printer control swapper. The bit definitions are as follows:

BIT	7	6	5	4	3	2	1	0
NAME	RESERVED		DIR	IRQ ENABLE	SLCT IN	INIT#	AUTO FD	STROBE
DEFAULT	1	1	NA	0	NA	NA	NA	NA

BIT	DESCRIPTION
7-6	**RESERVED.** These two bits are always read as logical 1 and can be written.
5	**DIR (Direction Control Bit).** When this bit is logical 1, the parallel port is in the input mode (read). When it is logical 0, the parallel port is in the output mode (write). This bit can be read and written. In SPP mode, this bit is invalid and fixed at zero.
4	**IRQ ENABLE.** A logical 1 allows an interrupt to occur when ACK# changes from low to high.
3	**SLCT IN.** a logical 1 selects the printer.
2	**INIT#.** A logical 0 starts the printer (50 microsecond pulse, minimum).
1	**AUTO FD.** A logical 1 causes the printer to line-feed after a line is printed.
0	**STROBE.** A logical 1 generates an active-high pulse for a minimum of 0.5 μs to clock data into the printer. Valid data must be presented for a minimum of 0.5 μs before and after the strobe pulse.

10.2.4 EPP Address Port

The address port is available only in EPP mode. Bit definitions are as follows:

BIT	7	6	5	4	3	2	1	0
NAME	PD7	PD6	PD5	PD4	PD3	PD2	PD1	PD0

The contents of DB0-DB7 are buffered (non-inverting) and output to ports PD0-PD7 during a write operation. The leading edge of IOW# causes an EPP address write cycle to be performed, and the trailing edge of IOW# latches the data for the duration of the EPP write cycle.

PD0-PD7 ports are read during a read operation. The leading edge of IOR# causes an EPP address read cycle to be performed and the data to be output to the host CPU.

10.2.5 EPP Data Port 0-3

These four registers are available only in EPP mode. The bit definitions for each data port are the same and as follows:

BIT	7	6	5	4	3	2	1	0
NAME	PD7	PD6	PD5	PD4	PD3	PD2	PD1	PD0

When any EPP data port is accessed, the contents of DB0-DB7 are buffered (non-inverting) and output to ports PD0-PD7 during a write operation. The leading edge of IOW# causes an EPP data write cycle to be performed, and the trailing edge of IOW# latches the data for the duration of the EPP write cycle.

During a read operation, ports PD0-PD7 are read, and the leading edge of IOR# causes an EPP read cycle to be performed and the data to be output to the host CPU.

10.2.6 EPP Pin Descriptions

EPP NAME	TYPE	EPP DESCRIPTION
NWrite	O	Denotes read or write operation for address or data.
PD<0:7>	I/O	Bi-directional EPP address and data bus.
Intr	I	Used by peripheral device to interrupt the host.
NWait	I	Inactivated to acknowledge that data transfer is complete. Activated to indicate that the device is ready for the next transfer.
PE	I	Paper end; same as SPP mode.
Select	I	Printer-select status; same as SPP mode.
NDStrb	O	This signal is active low. It denotes a data read or write operation.
Nerror	I	Error; same as SPP mode.
Ninits	O	This signal is active low. When it is active, the EPP device is reset to its initial operating mode.
NAStrb	O	This signal is active low. It denotes an address read or write operation.

10.2.7 EPP Operation

When EPP mode is selected, the PDx bus is in standard or bi-directional mode when no EPP read, write, or address cycle is being executed. In this situation, all output signals are set by the SPP Control Port and the direction is controlled by DIR of the Control Port.

A watchdog timer is required to prevent system lockup. The timer indicates that more than 10 μS have elapsed from the start of the EPP cycle to the time WAIT# is deasserted. The current EPP cycle is aborted when a time-out occurs. The time-out condition is indicated in status bit 0.

The EPP operates on a two-phase cycle. First, the host selects the register within the device for subsequent operations. Second, the host performs a series of read and/or write byte operations to the selected register. Four operations are supported on the EPP: Address Write, Data Write, Address Read, and Data Read. All operations on the EPP device are performed asynchronously.

10.2.7.1. EPP Version 1.9 Operation

The EPP read/write operation can be completed under the following conditions:

a. If nWait is active low, the read cycle (nWrite inactive high, nDStrb/nAStrb active low) or write cycle (nWrite active low, nDStrb/nAStrb active low) starts, proceeds normally, and is completed when nWait goes inactive high.

b. If nWait is inactive high, the read/write cycle cannot start. It must wait until nWait changes to active low, at which time it starts as described above.

10.2.7.2. EPP Version 1.7 Operation

The EPP read/write cycle can start without checking whether nWait is active or inactive. Once the read/write cycle starts, however, it does not finish until nWait changes from active low to inactive high.

10.3 Extended Capabilities Parallel (ECP) Port

This port is software- and hardware-compatible with existing parallel ports, so the NCT6683D-LU parallel port may be used in standard printer mode if ECP is not required. It provides an automatic high burst-bandwidth channel that supports DMA for ECP in both the forward (host-to-peripheral) and reverse (peripheral-to-host) directions.

Small FIFOs are used in both forward and reverse directions to improve the maximum bandwidth requirement. The size of the FIFO is 16 bytes. The ECP port supports an automatic handshake for the standard parallel port to improve compatibility mode transfer speed.

The ECP port hardware supports run-length-encoded (RLE) decompression. Compression is accomplished by counting identical bytes and transmitting an RLE byte that indicates how many times the next byte is to be repeated. RLE compression is required; the hardware support is optional.

For more information about the ECP Protocol, refer to the Extended Capabilities Port Protocol and ISA Interface Standard.

The NCT6683D-LU ECP supports the following modes.

Table 10-4 ECP Mode Description

MODE	DESCRIPTION

MODE	DESCRIPTION
000	SPP mode
001	PS/2 Parallel Port mode
010	Parallel Port Data FIFO mode
011	ECP Parallel Port mode
100	EPP mode (If this option is enabled in the CRF0h to select ECP/EPP mode)
101	Reserved
110	Test mode
111	Configuration mode

The mode selection bits are bits 7-5 of the Extended Control Register.

10.3.1 ECP Register and Bit Map

The next two tables list the registers used in ECP mode and provide a bit map of the parallel port and ECP registers.

Table 10-5 ECP Register Addresses

NAME	ADDRESS	I/O	ECP MODES	FUNCTION
data	Base+000h	R/W	000-001	Data Register
ecpAFifo	Base+000h	R/W	011	ECP FIFO (Address)
dsr	Base+001h	R	All	Status Register
dcr	Base+002h	R/W	All	Control Register
cFifo	Base+400h	R/W	010	Parallel Port Data FIFO
ecpDFifo	Base+400h	R/W	011	ECP FIFO (DATA)
tFifo	Base+400h	R/W	110	Test FIFO
cnfgA	Base+400h	R	111	Configuration Register A
cnfgB	Base+401h	R/W	111	Configuration Register B
ecr	Base+402h	R/W	All	Extended Control Register

Note: The base addresses are specified by CR60 and 61, which are determined by configuration register or hardware setting.

Table 10-6 Bit Map of the ECP Registers

	D7	D6	D5	D4	D3	D2	D1	D0	NOTE
Data	PD7	PD6	PD5	PD4	PD3	PD2	PD1	PD0	
ecpAFifo	Addr/RLE	Address or RLE field							2
Dsr	nBusy	nAck	PError	Select	nFault	1	1	1	1
Dcr	1	1	Directio	ackIntEn	SelectIn	nInit	Autofd	strobe	1
cFifo	Parallel Port Data FIFO								2
ecpFifo	ECP Data FIFO								2
tFifo	Test FIFO								2
cnfgA	0	0	0	1	0	0	0	0	
cnfgB	compress	intrValue	1	1	1	1	1	1	
Ecr	MODE			nErrIntrEn	dmaEn	serviceIntr	full	empty	

Notes:
1. These registers are available in all modes.
2. All FIFOs use one common 16-byte FIFO.

Each register (or pair of registers, in some cases) is discussed below.

10.3.2 Data and ecpAFifo Port

Modes 000 (SPP) and 001 (PS/2) (Data Port)

During a write operation, the Data Register latches the contents of the data bus on the rising edge of the input, and the contents of this register are output to PD0-PD7. During a read operation, ports PD0-PD7 are read and output to the host. The bit definitions are as follows:

BIT	7	6	5	4	3	2	1	0
NAME	PD7	PD6	PD5	PD4	PD3	PD2	PD1	PD0

Mode 011 (ECP FIFO-Address/RLE)

A data byte written to this address is placed in the FIFO and tagged as an ECP Address/RLE. The hardware at the ECP port transmits this byte to the peripheral automatically. This operation is defined only for the forward direction. The bit definitions are as follows:

BIT	7	6	5	4	3	2	1	0
NAME	Address/RLE	Address or RLE						

10.3.3 Device Status Register (DSR)

These bits are logical 0 during a read of the Printer Status Register. The bits of this status register are defined as follows:

BIT	7	6	5	4	3	2	1	0
NAME	nBusy	nAck	PError	Select	nFault	1	1	1

BIT	DESCRIPTION
7	**nBusy.** This bit reflects the complement of the Busy input.
6	**nAck.** This bit reflects the nAck input.
5	**PError.** This bit reflects the PError input.
4	**Select.** This bit reflects the Select input.
3	**nFault.** This bit reflects the nFault input.
2-0	These three bits are not implemented and are always logical 1 during a read.

10.3.4 Device Control Register (DCR)

The bit definitions are as follows:

BIT	7	6	5	4	3	2	1	0
NAME	Reserved		Director	ackInEn	SelectIn	nInit	Autofd	Strobe
DEFAULT	1	1	NA	NA	NA	NA	NA	NA

BIT	DESCRIPTION
7-6	**Reserved.** These two bits are always read as logical 1 and cannot be written.
5	**Director.** If the mode is 000 or 010, this bit has no effect and the direction is always out. In other modes, 0: The parallel port is in the output mode. 1: The parallel port is in the input mode.
4	**ackInEn** (Interrupt Request Enable). When this bit is set to logical 1, it enables interrupt requests from the parallel port to the CPU on the low-to-high transition on ACK#.
3	**SelectIn.** This bit is inverted and output to the SLIN# output. 0: The printer is not selected. 1: The printer is selected.
2	**nInit.** This bit is output to the INIT# output.
1	**Autofd.** This bit is inverted and output to the AFD# output.
0	**Strobe.** This bit is inverted and output to the STB# output.

10.3.5 CFIFO (Parallel Port Data FIFO) Mode = 010

This mode is defined only for the forward direction. Bytes written or DMAed to this FIFO are transmitted by a hardware handshake to the peripheral using the standard parallel port protocol. Transfers to the FIFO are byte-aligned.

10.3.6 ECPDFIFO (ECP Data FIFO) Mode = 011

When the direction bit is 0, bytes written or DMAed to this FIFO are transmitted by a hardware handshake to the peripheral using the ECP parallel port protocol. Transfers to the FIFO are byte-aligned.

When the direction bit is 1, data bytes from the peripheral are read via automatic hardware handshake from ECP into this FIFO. Reads or DMAs from the FIFO return bytes of ECP data to the system.

10.3.7 TFIFO (Test FIFO Mode) Mode = 110

Data bytes may be read, written, or DMAed to or from the system to this FIFO in any direction. Data in the tFIFO is not transmitted to the parallel port lines. However, data in the tFIFO may be displayed on the parallel port data lines.

10.3.8 CNFGA (Configuration Register A) Mode = 111

This register is a read-only register. When it is read, 10H is returned. This indicates that this is an 8-bit implementation.

10.3.9 CNFGB (Configuration Register B) Mode = 111

The bit definitions are as follows:

BIT	7	6	5	4	3	2	1	0
NAME	COMPRESS	intrVALUE	IRQx2	IRQx1	IRQx0	RESERVED		
DEFAULT	0	0	0	0	0	1	1	1

BIT	DESCRIPTION
7	**Compress.** This bit is read-only. It is logical 0 during a read, which means that this chip does not support hardware RLE compression.
6	**intrValue.** Returns the value on the ISA IRQ line to determine possible conflicts.
5	**IRQx2.** Reflects the IRQ resource assigned for ECP port.
4	**IRQx1.**
3	**IRQx0.**
2-0	**Reserved.** These three bits are logical 1 during a read and can be written.

cnfgB[5:3]	IRQ resource
000	Reflects other IRQ resources selected by PnP register (default)
001	IRQ7
010	IRQ9
011	IRQ10
100	IRQ11
101	IRQ14
110	IRQ15
111	IRQ5

10.3.10ECR (Extended Control Register) Mode = all

This register controls the extended ECP parallel port functions. The bit definitions are follows:

BIT	7	6	5	4	3	2	1	0
NAME	MODE			nErrIntrEn	dmaEn	ServiceIntr	Full	Empty
DEFAULT	0	0	0	1	0	1	0	1

BIT	DESCRIPTION

<table>
<tr><th>BIT</th><th>DESCRIPTION</th></tr>
<tr><td>7-5</td><td>Mode. Read/Write. These bits select the mode.
<table>
<tr><td>000</td><td>Standard Parallel Port (SPP) mode. The FIFO is reset in this mode.</td></tr>
<tr><td>001</td><td>PS/2 Parallel Port mode. This is the same as SPP mode except that direction may be used to tri-state the data lines. Furthermore, reading the data register returns the value on the data lines, not the value in the data register.</td></tr>
<tr><td>010</td><td>Parallel Port FIFO mode. This is the same as SPP mode except that bytes are written or DMAed to the FIFO. FIFO data are automatically transmitted using the standard parallel port protocol. This mode is useful only when direction is 0.</td></tr>
<tr><td>011</td><td>ECP Parallel Port Mode. When the direction is 0 (forward direction), bytes placed into the ecpDFifo and bytes written to the ecpAFifo are placed in a single FIFO and automatically transmitted to the peripheral using the ECP Protocol. When the direction is 1 (reverse direction), bytes are moved from the ECP parallel port and packed into bytes in the ecpDFifo.</td></tr>
<tr><td>100</td><td>EPP Mode. EPP mode is activated if the EPP mode is selected.</td></tr>
<tr><td>101</td><td>Reserved.</td></tr>
<tr><td>110</td><td>Test Mode. The FIFO may be written and read in this mode, but the data is not transmitted on the parallel port.</td></tr>
<tr><td>111</td><td>Configuration Mode. The confgA and confgB registers are accessible at 0x400 and 0x401 in this mode.</td></tr>
</table></td></tr>
<tr><td>4</td><td>nErrIntrEn. Read/Write (Valid only in ECP Mode)
0: Enables the interrupt generated on the falling edge of nFault. This prevents interrupts from being lost in the time between the read of the ECR and the write of the ECR.
1: Disables the interrupt generated on the asserting edge of nFault.</td></tr>
<tr><td>3</td><td>dmaEn. Read/Write.
0: Disable DMA unconditionally.
1: Enable DMA.</td></tr>
<tr><td>2</td><td>serviceIntr. Read/Write.
0: Enable one of the following cases of interrupts. When one of the serviced interrupts occurs, this bit is set to logical 1 by the hardware. This bit must be rest to logical 0 to re-enable the interrupts.
(a) dmaEn = 1: During DMA, this bit is set to logical 1 when terminal count is reached.
(b) dmaEn = 0, direction = 0: This bit is set to logical 1 whenever there are writeIntr threshold or more bytes free in the FIFO.
(c) dmaEn = 0, direction = 1: This bit is set to logical 1 whenever there are readIntr threshold or more valid bytes to be read from the FIFO.
1: Disable DMA and all of the service interrupts. Writing a logical 1 to this bit does not cause an interrupt.</td></tr>
<tr><td>1</td><td>Full. Read Only.
0: The FIFO has at least one free byte.
1: The FIFO is completely full; it cannot accept another byte.</td></tr>
<tr><td>0</td><td>Empty. Read Only.
0: The FIFO contains at least one byte of data.
1: The FIFO is completely empty.</td></tr>
</table>

10.3.11 ECP Pin Descriptions

NAME	TYPE	DESCRIPTION
NStrobe (HostClk)	O	This pin loads data or address into the slave on its asserting edge during write operations. This signal handshakes with Busy.
PD<7:0>	I/O	These signals contain address, data or RLE data.
nAck (PeriphClk)	I	This signal indicates valid data driven by the peripheral when asserted. This signal handshakes with nAutoFd in reverse.
Busy (PeriphAck)	I	This signal deasserts to indicate that the peripheral can accept data. In the reverse direction, it indicates whether the data lines contain ECP command information or data. Normal data are transferred when Busy (PeriphAck) is high, and an 8-bit command is transferred when it is low.
PError (nAckReverse)	I	This signal is used to acknowledge a change in the direction of the transfer (asserted = forward). The peripheral drives this signal low to acknowledge nReverseRequest. The host relies upon nAckReverse to determine when it is permitted to drive the data bus.
Select (Xflag)	I	Indicates printer on-line.
NautoFd (HostAck)	O	Requests a byte of data from the peripheral when it is asserted. In the forward direction, this signal indicates whether the data lines contain ECP address or data. Normal data are transferred when nAutoFd (HostAck) is high, and an 8-bit command is transferred when it is low.
nFault (nPeriphReuqest)	I	Generates an error interrupt when it is asserted. This signal is valid only in the forward direction. The peripheral is permitted (but not required) to drive this pin low to request a reverse transfer during ECP mode.
nInit (nReverseRequest)	O	This signal sets the transfer direction (asserted = reverse, deasserted = forward). This pin is driven low to place the channel in the reverse direction.
nSelectIn (ECPMode)	O	This signal is always deasserted in ECP mode.

10.3.12ECP Operation

The host must negotiate on the parallel port to determine if the peripheral supports the ECP protocol before ECP operation. After negotiation, it is necessary to initialize some of the port bits.

(a) Set direction = 0, enabling the drivers.

(b) Set strobe = 0, causing the nStrobe signal to default to the deasserted state.

(c) Set autoFd = 0, causing the nAutoFd signal to default to the deasserted state.

(d) Set mode = 011 (ECP Mode)

ECP address/RLE bytes or data bytes may be sent automatically by writing the ecpAFifo or ecpDFifo, respectively.

10.3.12.1. Mode Switching

The software must handle P1284 negotiation and all operations prior to a data transfer in SPP or PS/2 modes (000 or 001). The hardware provides an automatic control line handshake, moving data between the FIFO and the ECP port, only in the data transfer phase (mode 011 or 010).

If the port is in mode 000 or 001, it may switch to any other mode. If the port is not in mode 000 or 001, it can only be switched into mode 000 or 001. The direction can only be changed in mode 001.

In extended forward mode, the software should wait for the FIFO to be empty before switching back to mode 000 or 001. In ECP reverse mode, the software should wait for all the data to be read from the FIFO before changing back to mode 000 or 001.

10.3.12.2. Command/Data

ECP mode allows the transfer of normal 8-bit data or 8-bit commands. In the forward direction, normal data are transferred when HostAck is high, and an 8-bit command is transferred when HostAck is low. The most significant bits of the command indicate whether it is a run-length count (for compression) or a channel address.

In the reverse direction, normal data are transferred when PeriphAck is high, and an 8-bit command is transferred when PeriphAck is low. The most significant bit of the command is always zero.

10.3.12.3. Data Compression

The NCT6683D-LU hardware supports RLE decompression and can transfer compressed data to a peripheral. Odd (RLE) compression is not supported in the hardware, however. In order to transfer data in ECP mode, the compression count is written to ecpAFifo and the data byte is written to ecpDFifo.

10.3.13FIFO Operation

The FIFO threshold is set in CR5. All data transferred to or from the parallel port can proceed in DMA or Programmed I/O (non-DMA) mode, as indicated by the selected mode. The FIFO is used in Parallel Port FIFO mode or ECP Parallel Port Mode. After a reset, the FIFO is disabled.

10.3.14DMA Transfers

DMA transfers are always to or from the ecpDFifo, tFifo, or CFifo. DMA uses the standard PC DMA services. The ECP requests DMA transfers from the host by activating the PDRQ pin. The DMA empties or fills the FIFO using the appropriate direction and mode. When the terminal count in the DMA controller is reached, an interrupt is generated, and serviceIntr is asserted, which will disable the DMA.

10.3.15Programmed I/O (NON-DMA) Mode

The ECP and parallel port FIFOs can also be operated using interrupt-driven, programmed I/O. Programmed I/O transfers are

1. To the ecpDFifo at 400H and ecpAFifo at 000H
2. From the ecpDFifo located at 400H
3. To / from the tFifo at 400H.

The host must set dmaEn and serviceIntr to 0 and also must set the direction and state accordingly in the programmed I/O transfers.

The ECP requests programmed I/O transfers from the host by activating the IRQ pin. The programmed I/O empties or fills the FIFO using the appropriate direction and mode.

11. KEYBOARD CONTROLLER

The NCT6683D-LU KBC (8042 with licensed KB BIOS) circuit is designed to provide the functions needed to interface a CPU with a keyboard and/or a PS/2 mouse and can be used with IBM®-compatible personal computers or PS/2-based systems. The controller receives serial data from the keyboard or PS/2 mouse, checks the parity of the data, and presents the data to the system as a byte of data in its output buffer. Then, the controller asserts an interrupt to the system when data are placed in its output buffer. The keyboard and PS/2 mouse are required to acknowledge all data transmissions. No transmission should be sent to the keyboard or PS/2 mouse until an acknowledgement is received for the previous data byte.

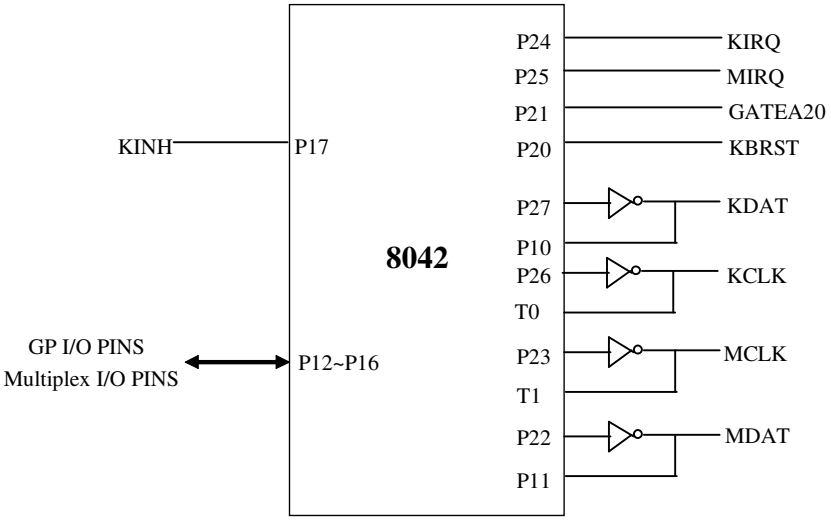

Figure 11-1 Keyboard and Mouse Interface

11.1 Output Buffer

The output buffer is an 8-bit, read-only register at I/O address 60H (Default, PnP programmable I/O address LD5-CR60 and LD5-CR61). The keyboard controller uses the output buffer to send the scan code (from the keyboard) and required command bytes to the system. The output buffer can only be read when the output buffer full bit in the register (in the status register) is logical 1.

11.2 Input Buffer

The input buffer is an 8-bit, write-only register at I/O address 60h or 64h (Default, PnP programmable I/O address LD5-CR60, LD5-CR61, LD5-CR62, and LD5-CR63). Writing to address 60h sets a flag to indicate a data write; writing to address 64h sets a flag to indicate a command write. Data written to I/O address 60h is sent to the keyboard (unless the keyboard controller is expecting a data byte) through the controller's input buffer only if the input buffer full bit (in the status register) is logical 0.

11.3 Status Register

The status register is an 8-bit, read-only register at I/O address 64h (Default, PnP programmable I/O address LD5-CR62 and LD5-CR63) that holds information about the status of the keyboard controller and interface. It may be read at any time.

Table 11-1 Bit Map of Status Register

BIT	BUT FUNCTION	DESCRIPTION
0	Output Buffer Full	0: Output buffer empty 1: Output buffer full
1	Input Buffer Full	0: Input buffer empty 1: Input buffer full
2	System Flag	This bit may be set to 0 or 1 by writing to the system flag bit in the command byte of the keyboard controller. It defaults to 0 after a power-on reset.
3	Command/Data	0: Data byte 1: Command byte
4	Inhibit Switch	0: Keyboard is inhibited 1: Keyboard is not inhibited
5	Auxiliary Device Output Buffer	0: Auxiliary device output buffer empty 1: Auxiliary device output buffer full
6	General Purpose Time-out	0: No time-out error 1: Time-out error
7	Parity Error	0: Odd parity 1: Even parity (error)

11.5 Hardware GATEA20/Keyboard Reset Control Logic

The KBC includes hardware control logic to speed-up GATEA20 and KBRESET. This control logic is controlled by LD5-CRF0 as follows:

11.5.1 KB Control Register (Logic Device 5, CR-F0)

BIT	7	6	5	4	3	2	1	0

NAME	KCLKS1	KCLKS0	RESERVED			P92EN	HGA20	HKBRST#
DEFAULT	1	0	0	0	0	0	0	0

BIT	DESCRIPTION	
7	**KCLKS1.**	Select the KBC clock rate. **Bits** **7 6** 0 0: Reserved. 0 1: Reserved. 1 0: KBC clock input is 12 MHz. 1 1: Reserved.
6	**KCLKS0.**	
5-3	**RESERVED.**	
2	**P92EN (Port 92 Enable).** 1: Enables Port 92 to control GATEA20 and KBRESET. 0: Disables Port 92 functions.	
1	**HGA20 (Hardware GATEA 20).** 1: Selects hardware GATE A20 control logic to control GATE A20 signal. 0: Disables GATEA20 control logic functions.	
0	**HKBRST# (Hardware Keyboard Reset).** 1: Selects hardware KB RESET control logic to control KBRESET signal. 0: Disables hardware KB RESET control logic function.	

When the KBC receives data that follows a "D1" command, the hardware control logic sets or clears GATE A20 according to received data bit 1. Similarly, the hardware control logic sets or clears KBRESET depending on received data bit 0. When the KBC receives an "FE" command, the KBRESET is pulse low for 6 μs (Min.) with a 14 μs (Min.) delay.

GATE A20 and KBRESET are controlled by either software or hardware logic, and they are mutually exclusive. Then, GATE A20 and KBRESET are merged with Port92 when the P92EN bit is set.

11.5.2 Port 92 Control Register (Default Value = 0x24)

BIT	7	6	5	4	3	2	1	0
NAME	RES. (0)		RES. (1)	RES. (0)		RES. (1)	SGA20	PLKBRST#
DEFAULT	0	0	1	0	0	1	0	0

BIT	DESCRIPTION
7-6	**RES. (0)**
5	**RES. (1)**
4-3	**RES. (0)**
2	**RES. (1)**
1	**SGA20 (Special GATE A20 Control)** 1: Drives GATE A20 signal to high. 0: Drives GATE A20 signal to low.

0	**PLKBRST# (Pulled-low KBRESET).** A logical 1 on this bit causes KBRESET to drive low for 6 µS(Min.) with a 14 µS(Min.) delay. Before issuing another keyboard-reset command, the bit must be cleared.

12. POWER MANAGEMENT EVENT

The PME# signal is connected to the South Bridge and is used to wake up the system from S1 ~ S5 sleeping states.

Four registers in the NCT6683D-LU are associated with the PME function. The four registers are divided into PME status registers and PME interrupt registers of wake-up events [Note.1].

1) The PME status registers of wake-up event:
   - At ACPI interface base address +0, +1, +2, and +3h register
   - Each wake-up event has its own status
   - The PME status should be cleared by writing a "1" before enabling its corresponding bit in the PME interrupt registers
2) The PME interrupt registers of wake-up event:
   - At ACPI interface base address +4, +5, +6, and +7h register
   - Each wake-up event can be enabled / disabled individually to generate a PME# signal

Note.1 PME wake-up events that the NCT6683D-LU supports include:

- Mouse IRQ event*
- Keyboard IRQ event*
- Printer IRQ event
- Floppy IRQ event
- UART A/B IRQ event
- CIR IRQ event*
- Hardware Monitor / EC Space IRQ event
- RIB (UARTB Ring Indicator) event

Note.2 All the events above support waking system from S1 state. Events with the "*" mark could also support S3 and S5 states if MCU firmware is customized for this.

12.1 System Wakeup Control (SWC)

12.1.1 OVERVIEW

The SWC function block receives external events from system and internal events from internal functional modules. Based on these events, the SWC generates power management event (PME)/system control interrupt (SCI) and system management interrupt (SMI). These signals can also be directed to serial IRQ or MCU interrupt event.

The SWC receives the following external events:

- 16 genera purpose I/O enhance port (GPEN00 – GPEN07, GPEN10 – GPEN17).

The SWC receives the following internal events:

- PRT, UARTA, UARTB, KBC, CIR, GPIO, HM and EC port0/1/2 functional block interrupt events.
- HM SCI event.
- MCU general purpose events.

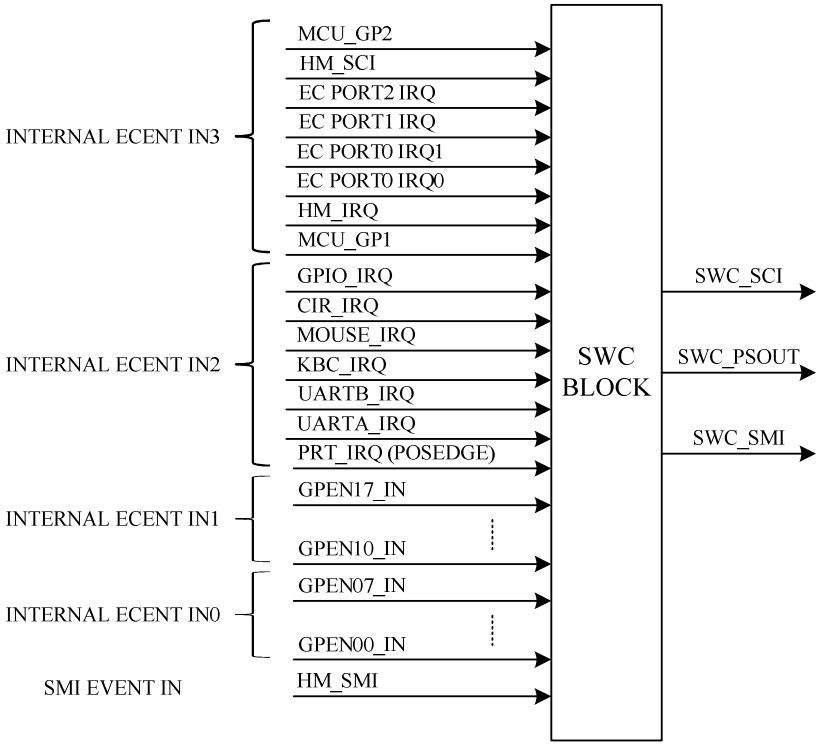

Figure 12-1 SWC Block Connection

The SWC outputs SWC_SCI, SWC_SMI and SWC_PSOUT signal.

- SWC_SCI is connected to PME# function pin and it can generate SCI/PME event to system. It can be route to serial IRQ and MCU module to generate interrupt event if its related register enabled.
- SWC_PSOUT is connected to MCU module and it can generate interrupt event to MCU. It informs MCU to generate PSOUT event.
- SWC_SMI is connected to SMI#/OVT# function pin and it can generate SMI#/OVT# event to system. It can be route to serial IRQ channel 2 and MCU module to generate interrupt event if its related register enabled.

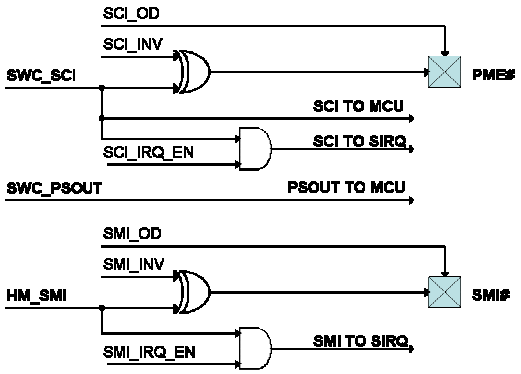

Figure 12-2 SWC signal routing path

12.1.2 Function Description

The SWC function is based on *ACPI Specification Revision3.0 September2, 2004* general-purpose event register blocks. The SWC has an EVENT register group, EVENT_EN/EVENT_STS, to support 16 external events and 16 internal events.

NCT6683D-LU supports two system wakeup signals, PSOUT# and PME#. Each wakeup event input can only be routed to one of them by SCI_PSOUT_ROUTE. System can access two different register groups GPE_EN/GPE_STS and PSOUT_EN/PSOUT_STS in order to separate PSOUT and GPE events.

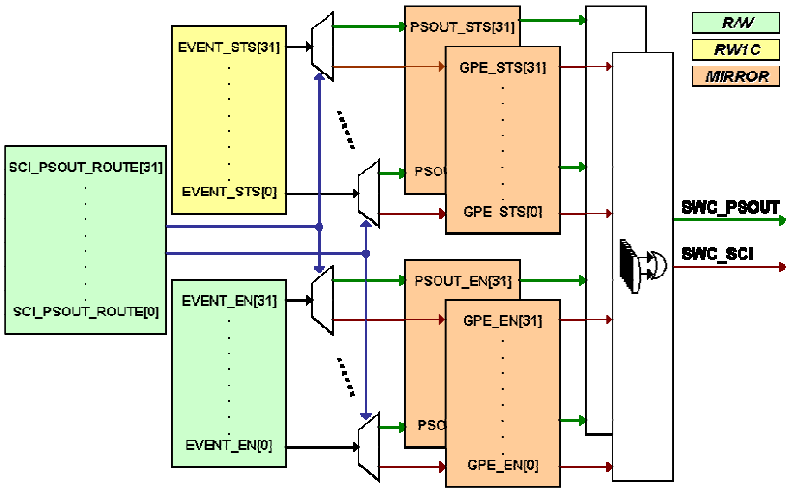

Figure 12-3 SWC registers block diagram

12.1.2.1. External Events

The SWC function receives 16 external GPEN (GPEN17-10, GPEN07-00) inputs as level high active event. Each GPEN function pin has its programmable parity and de-bounces time. After setting GPEN function pin multiplex, parity and de-bounces time, write 1 to its status bit to clear its status event.

12.1.2.2. Internal Events

The SWC function receives 3 kinds of internal event, internal device's IRQ, HM SCI and MCU general purpose event.

- Internal device's IRQ: SWC function receives 13 internal device's IRQ as event input. UARTA, UARTB, KBC, MOUSE, CIR, GPIO, HM and EC PORT0/12 IRQ are level high active event. PRT IRQ signal is edge high-active event.
- HM SCI and MCU general purpose event: They are generated by firmware operation. It includes KBC/Mouse wakeup, CIR wakeup, PSIN, UARTA/B RI#, GPIO input event or others firmware wakeup event.

12.1.2.3. Waken up by Keyboard events

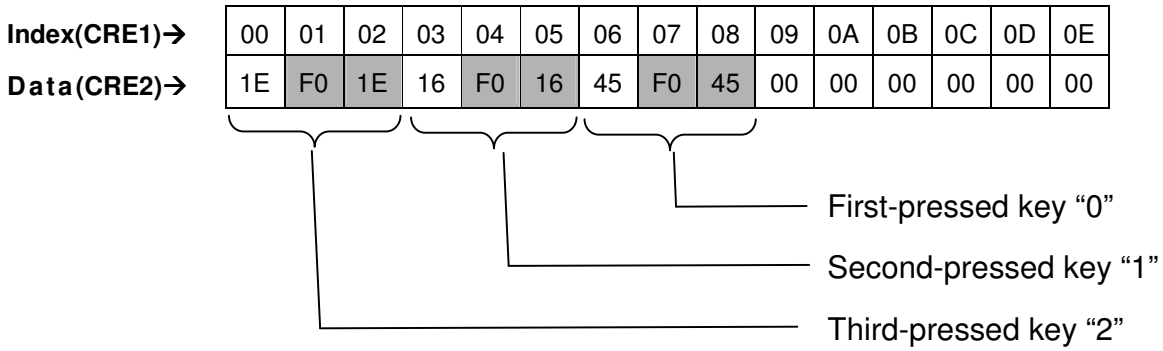
To enable the keyboard Wake-Up function, corresponding function in EC Space register should be initialized by BIOS first, and then BIOS should set "KBC IRQ GPE enable" (and "KBC IRQ PSOUT enable", if the wakeup signal was to be routed to PSOUT), and clear the corresponding status flags (write 1 to corresponding bit locations).

There are two keyboard events can be used for the wake-up

1) Any key – Set bit 0 at Logical Device A, CR[E0h] to "1" (Default).
2) Specific keys (Password) - Set bit 0 at Logical Device A, CR[E0h] to "0".

Three sets of specific key combinations are stored at Logical Device A. CR[E1h] is an index register to indicate which byte of key code storage (0x00h ~ 0x0Eh, 0x30h ~ 0x3Eh, 0x40h ~ 0x4Eh) is going to be read or written through CR[E2h]. According to IBM 101/102 keyboard specification, a complete key code contains a 1-byte make code and a 2-byte break code. For example, the make code of "0" is 0x45h, and the corresponding break code is 0xF0h, 0x45h.

The approach to implement Keyboard Password Wake-Up Function is to fill key codes into the password storage. Assume that we want to set "012" as the password. The storage should be filled as below. Please note that index 0x09h ~ 0x0Eh must be filled as 0x00h since the password has only three numbers.



12.1.2.4. Waken up by Mouse events

To enable the keyboard Wake-Up function, corresponding function in EC Space register should be initialized by BIOS first, and then BIOS should set "MOUSE IRQ GPE enable" (and "MOUSE IRQ PSOUT enable", if the wakeup signal was to be routed to PSOUT), and clear the corresponding status flags (write 1 to corresponding bit locations).

The following specific mouse events can be used for the wake-up:

- Any button clicked or any movement
- One click of the left or the right button
- One click of the left button
- One click of the right button
- Two clicks of the left button
- Two clicks of the right button.

Three control bits (ENMDAT_UP, MSRKEY, MSXKEY) define the combinations of the mouse wake-up events. Please see the following table for the details.

Table 12-1 Definitions of Mouse Wake-Up Events

ENMDAT_UP (LOGICAL DEVICE A, CR[E6H], BIT 7)	MSRKEY (LOGICAL DEVICE A, CR[E0H], BIT 4)	MSXKEY (LOGICAL DEVICE A, CR[E0H], BIT 1)	WAKE-UP EVENT
1	x	1	Any button clicked or any movement.
1	x	0	One click of the left or right button.

ENMDAT_UP (LOGICAL DEVICE A, CR[E6H], BIT 7)	MSRKEY (LOGICAL DEVICE A, CR[E0H], BIT 4)	MSXKEY (LOGICAL DEVICE A, CR[E0H], BIT 1)	WAKE-UP EVENT
0	0	1	One click of the left button.
0	1	1	One click of the right button.
0	0	0	Two clicks of the left button.
0	1	0	Two clicks of the right button.

12.1.3 Registers

NOTICE :

1. GPEN, EC Ports, and MCU general purpose events are internal resources of MCU. Almost all of these registers are controlled by MCU. Please follow programming guide when implementing functions covered in this chapter (e.g. wake up system from sleep state by keyboard) .
2. All XXX Status registers were active only when corresponding XXX Enable registers were enabled.

12.1.3.1. General Purpose Event Status 0 – Base Address + 0

Attribute: RW1C
Power Well: VSB
Reset by: RSMRST #
Default : 00h
Size: 8 bits

BIT	READ / WRITE	DESCRIPTION
7	RW1C	GPEN07 GPE status
6	RW1C	GPEN06 GPE status
5	RW1C	GPEN05 GPE status
4	RW1C	GPEN04 GPE status
3	RW1C	GPEN03 GPE status
2	RW1C	GPEN02 GPE status
1	RW1C	GPEN01 GPE status
0	RW1C	GPEN00 GPE status

12.1.3.2. General Purpose Event Status 1 – Base Address + 1

Attribute: RW1C
Power Well: VSB
Reset by: RSMRST #
Default : 00h
Size: 8 bits

BIT	READ / WRITE	DESCRIPTION
7	RW1C	GPEN17 GPE status

BIT	READ / WRITE	DESCRIPTION
6	RW1C	GPEN16 GPE status
5	RW1C	GPEN15 GPE status
4	RW1C	GPEN14 GPE status
3	RW1C	GPEN13 GPE status
2	RW1C	GPEN12 GPE status
1	RW1C	GPEN11 GPE status
0	RW1C	GPEN10 GPE status

12.1.3.3. General Purpose Event Status 2 – Base Address + 2

Attribute: RW1C
Power Well: VSB
Reset by: RSMRST #
Default : 00h
Size: 8 bits

BIT	READ / WRITE	DESCRIPTION
7	RW1C	GPIO IRQ GPE status. Controlled by EC
6	RW1C	CIR IRQ GPE status
5	RW1C	MOUSE IRQ GPE status
4	RW1C	KBC IRQ GPE status
3	RW1C	UARTB IRQ GPE status
2	RW1C	UARTA IRQ GPE status
1	RW1C	PRT IRQ positive-edge GPE status
0	Reserved	

12.1.3.4. General Purpose Event Status 3 – Base Address + 3

Attribute: RW1C
Power Well: VSB
Reset by: RSMRST #
Default : 00h
Size: 8 bits

BIT	READ / WRITE	DESCRIPTION
7	RW1C	MCU general purpose event 0 GPE status
6	RW1C	HM SCI GPE status
5	RW1C	EC PORT2 IRQ GPE status
4	RW1C	EC PORT1 IRQ GPE status
3	RW1C	EC PORT0 IRQ1 GPE status
2	RW1C	EC PORT0 IRQ0 GPE status
1	RW1C	HM IRQ GPE status

BIT	READ / WRITE	DESCRIPTION
0	RW1C	MCU general purpose event 1 GPE status

12.1.3.5. General Purpose Event Enable 0 – Base Address + 4

Attribute: RW
Power Well: VSB
Reset by: RSMRST #
Default : 00h
Size: 8 bits

BIT	READ / WRITE	DESCRIPTION
7	R / W	GPEN07 GPE enable
6	R / W	GPEN06 GPE enable
5	R / W	GPEN05 GPE enable
4	R / W	GPEN04 GPE enable
3	R / W	GPEN03 GPE enable
2	R / W	GPEN02 GPE enable
1	R / W	GPEN01 GPE enable
0	R / W	GPEN00 GPE enable

12.1.3.6. General Purpose Event Enable 1 – Base Address + 5

Attribute: RW
Power Well: VSB
Reset by: RSMRST #
Default : 00h
Size: 8 bits

BIT	READ / WRITE	DESCRIPTION
7	R / W	GPEN17 GPE enable
6	R / W	GPEN16 GPE enable
5	R / W	GPEN15 GPE enable
4	R / W	GPEN14 GPE enable
3	R / W	GPEN13 GPE enable
2	R / W	GPEN12 GPE enable
1	R / W	GPEN11 GPE enable
0	R / W	GPEN10 GPE enable

12.1.3.7. General Purpose Event Enable 2 – Base Address + 6

Attribute: RW
Power Well: VSB
Reset by: RSMRST #
Default : 00h
Size: 8 bits

BIT	READ / WRITE	DESCRIPTION
7	R / W	GPIO IRQ GPE enable. Controlled by EC
6	R / W	CIR IRQ GPE enable
5	R / W	MOUSE IRQ GPE enable
4	R / W	KBC IRQ GPE enable
3	R / W	UARTB IRQ GPE enable
2	R / W	UARTA IRQ GPE enable
1	R / W	PRT IRQ positive-edge GPE enable
0	Reserved	

12.1.3.8. General Purpose Event Enable 3 – Base Address + 7

Attribute: RW1C
Power Well: VSB
Reset by: RSMRST #
Default : 00h
Size: 8 bits

BIT	READ / WRITE	DESCRIPTION
7	RW1C	MCU general purpose event 0 GPE enable
6	RW1C	HM SCI GPE enable
5	RW1C	EC PORT2 IRQ GPE enable

0	RW1C	MCU general purpose event 1 PSOUT enable

13. SERIALIZED IRQ

The NCT6683D-LU supports a serialized IRQ scheme. This allows a signal line to be used to report the parallel interrupt requests. Since more than one device may need to share the signal serial SERIRQ signal, an open drain signal scheme is employed. The clock source is the PCI clock. The serialized interrupt is transferred on the SERIRQ signal, one cycle consisting of three frames types: the Start Frame, the IRQ/Data Frame, and the Stop Frame.

13.1 Start Frame

There are two modes of operation for the SERIRQ Start Frame: Quiet mode and Continuous mode.

In the Quiet mode, the NCT6683D-LU drives the SERIRQ signal active low for one clock, and then tri-states it. This brings all the state machines of the NCT6683D-LU from idle to active states. The host controller (the South Bridge) then takes over driving SERIRQ signal low in the next clock and continues driving the SERIRQ low for programmable 3 to 7 clock periods. This makes the total number of clocks low 4 to 8 clock periods. After these clocks, the host controller drives the SERIRQ high for one clock and then tri-states it.

In the Continuous mode, the START Frame can only be initiated by the host controller to update the information of the IRQ/Data Frame. The host controller drives the SERIRQ signal low for 4 to 8 clock periods. Upon a reset, the SERIRQ signal is defaulted to the Continuous mode for the host controller to initiate the first Start Frame.

Please see the diagram below for more details.

Start Frame Timing with source sampled a low pulse on IRQ1.

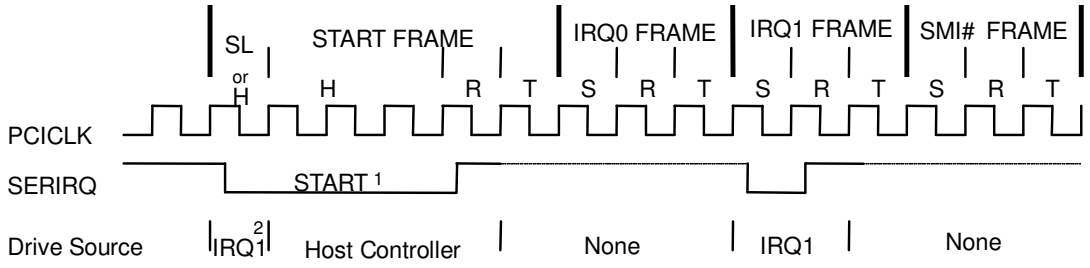

Figure 13-1 Start Frame Timing with Source Sampled A Low Pulse on IRQ1

H=Host Control SL=Slave Control R=Recovery T=Turn-around S=Sample

Note:

1. 1. The Start Frame pulse can be 4-8 clocks wide.
2. The first clock of Start Frame is driven low by the NCT6683D-LU because IRQ1 of the NCT6683D-LU needs an interrupt request. Then the host takes over and continues to pull the SERIRQ low.

13.2 IRQ/Data Frame

Once the Start Frame has been initiated, the NCT6683D-LU must start counting frames based on the rising edge of the start pulse. Each IRQ/Data Frame has three clocks: the Sample phase, the Recovery phase, and the Turn-around phase.

During the Sample phase, the NCT6683D-LU drives SERIRQ low if the corresponding IRQ is active. If the corresponding IRQ is inactive, then SERIRQ must be left tri-stated. During the Recovery phase, the NCT6683D-LU device drives the SERIRQ high. During the Turn-around phase, the NCT6683D-LU device leaves the SERIRQ tri-stated. The NCT6683D-LU starts to drive the SERIRQ line from the beginning of "IRQ0 FRAME" based on the rising edge of PCICLK.

The IRQ/Data Frame has a specific numeral order, as shown in Table 13.1.

Table 13-1 SERIRQ Sampling Periods

SERIRQ SAMPLING PERIODS			
IRQ/DATA FRAME	**SIGNAL SAMPLED**	**# OF CLOCKS PAST START**	**EMPLOYED BY**
1	IRQ0	2	Reserved
2	IRQ1	5	Keyboard
3	SMI#	8	H/W Monitor & SMI
4	IRQ3	11	UART B
5	IRQ4	14	UART A
6	IRQ5	17	-
7	IRQ6	20	-
8	IRQ7	23	LPT
9	IRQ8	26	-
10	IRQ9	29	-
11	IRQ10	32	-
12	IRQ11	35	-
13	IRQ12	38	Mouse
14	IRQ13	41	Reserved
15	IRQ14	44	-
16	IRQ15	47	-
17	IOCHCK#	50	-
18	INTA#	53	-
19	INTB#	56	-
20	INTC#	59	-
21	INTD#	62	-
32:22	Unassigned	95	-

13.3 Stop Frame

After all IRQ/Data Frames have completed, the host controller will terminates SERIRQ with a Stop frame. Only the host controller can initiate the Stop Frame by driving SERIRQ low for 2 or 3 clocks. If the Stop Frame is low for 2 clocks, the Sample mode of next SERIRQ cycle's Sample mode is the Quiet mode. If the Stop Frame is low for 3 clocks, the Sample mode of next SERIRQ cycle is the Continuous mode.

Please see the diagram below for more details.

Stop Frame Timing with Host Using 17 SERIRQ sampling period.

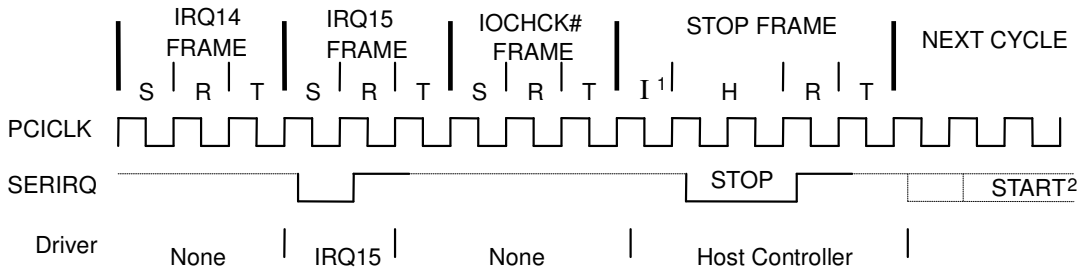

Figure 13-2 Stop Frame Timing with Host Using 17 SERIRQ Sampling Period

H=Host Control R=Recovery T=Turn-around S=Sample I= Idle.

Note:

1. There may be none, one or more Idle states during the Stop Frame.
2. The Start Frame pulse of next SERIRQ cycle may or may not start immediately after the turn-around clock of the Stop Frame.

14. CONSUMER INFRARED REMOTE (CIR)

NOTICE : Wakeup-related functions by CIR were implemented in EC Space. Please refer to NCT6683D Family EC Space Datasheet about this topic.

Regarding the receiving of IR Block, the hardware uses the sampling rates of 1us, 25us, 50us and 100us to calculate the widths of H Level and L Level. The results are saved/stored in 32*8 RX FIFO. The max widths of H Level and L Level will be determined by Sample Limit Count Register. During the receiving, the hardware will reflect the FIFO status in RX FIFO Status Register. In addition, the hardware also generates status, such as Data Ready, Trigger Level Reach, FIFO Overrun and FIFO underrun, in RC Status Register.

As for the transmission, the user has to set up the Carrier frequency and the transmission mode first and then writes the widths of H Level and L Level via TX FIFO. The hardware will add Carrier to H Level according to the transmission mode.

14.1 CIR Register Table

Table 14-1 CIR Register Table

RC Block									
ExtAddr	**Name**	**7**	**6**	**5**	**4**	**3**	**2**	**1**	**0**

14.1.1.1. IR Configuration Register – Base Address + 0

Attribute: Read/Write
Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	**Reserved**	**WIREN**	**TXEN**	**RXEN**	**WRXINV**	**RXINV**	**Sample Period Select**	
DEFAULT	0	0	0	0	0	1	0	0

BIT	DESCRIPTION
7	**Reserved**
6	**Wide-band IR Enable**
5	**TX Enable** 1: Transmission Enable. After confirming that FIFO is not empty, the transmission starts (the hardware will wait until TX FIFO data are written). If TX Enable is set to 0 during the transmission, the transmission stops when the transmission of FIFO data is completed. 0: Transmission Disable.
4	**RX Enable**
3	**Wide-band IR Rx Invert Enable** 0: Dongle Carrier ON is high, OFF (Idle) is low. 1: Dongle Carrier ON is low, OFF (Idle) is high.
2	**IR Rx Invert Enable** 0: Dongle Carrier ON is high, OFF (Idle) is low. 1: Dongle Carrier ON is low, OFF (Idle) is high.
1-0	**Sample Period Select** 00:1us, 01: 25us, 10: 50us, 11: 100us Note: In the 1us mode, the pulse mode will not function due to the IR regulations.

14.1.1.2. IR Status Register – Base Address + 1

Attribute: Read/Write
Size: 8 bits

BIT	7	6	5	4	3	2	1	0
Name	**RDR**	**RTR**	**PE**	**RFO**	**TE**	**TTR**	**TFU**	**GH**
DEFAULT	0	0	0	0	0	0	0	0

BIT	DESCRIPTION
7	**RX Data Ready** (Writing 1 will clear the bit).
6	**RX FIFO Trigger Level Reach** (Writing 1 will clear the bit).
5	**Packet End** (Writing 1 will clear the bit).
4	**RX FIFO Overrun** (Overrun and Data Ready will be simultaneously generated. Writing 1 will clear the bit).
3	**TX FIFO Empty** (Writing 1 will clear the bit).
2	**TX FIFO Trigger Level Reach** (Writing 1 will clear the bit).
1	**TX FIFO Underrun** (Writing 1 will clear the bit).
0	**Min Length Detected** (Writing 1 will clear the bit) 1: The IR Data length received is shorter than the default value. 0: The IR Data length received is longer than the default value.

14.1.1.3. IR Interrupt Configuration Register – Base Address + 2

Attribute: Read/Write
Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	RDR	RTR	PE	RFO	TE	TTR	TFU	GH
DEFAULT	0	0	0	0	0	0	0	0

1: Enable interrupt; 0: Disable interrupt

BIT	DESCRIPTION
7	**RX Data Ready**
6	**RX FIFO Trigger Level Reach**
5	**Packet End**
4	**RX FIFO Overrun** (Overrun and Data Ready will be simultaneously generated).
3	**TX FIFO Empty**
2	**TX FIFO Trigger Level Reach**
1	**TX FIFO Underrun**
0	**Min Length Detected**

Note. When an Interrupt occurs, it only can be cleared by writing IR Status Register to 1.

14.1.1.4. RX FIFO Count– Base Address + 5

Attribute: Read
Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	FIFO Count							
DEFAULT	0	0	0	0	0	0	0	0

1: Enable; 0: Disable

BIT	DESCRIPTION
7-0	**RX FIFO Count**

14.1.1.5. IR TX Carrier Prescalar Configuration Register (CP) – Base Address + 4

Attribute: Read/Write
Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	Mode	Reserved						CP
DEFAULT	0	0	0	0	0	0	0	0

BIT	DESCRIPTION
7	**Mode**

	0 : DC Mode 1 : Pulse Mode
6-1	**Reserved**.
0	**Carrier Prescalar** (CP). This bit is set for the Prescalar value of the IR TX carrier frequency.

14.1.1.6. IR TX Carrier Period Configuration Register (CC) – Base Address + 5

Attribute: Read/Write
Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	Carrier Period (CC)							
DEFAULT	0	0	0	0	0	0	0	0

BIT	DESCRIPTION
7-0	This byte is set for IR TX carrier period. The actual carrier period will be: Period = 2 * (2 ^ (CP*2)) * (CC+1) / (System Clock), where the frequency = 1 / period, and System Clock = 24MHz. Setting CP and CC to 0 will cause stop the device to from use using anyno carrier at all (that is, no light modulation, just constant on and off periods). The period count value CC can be any number from 0 to 255.

14.1.1.7. IR RX Sample Limited Count High Byte Register (RCLCH) – Base Address + 6

Attribute: Read/Write
Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	Sample Limited Count High Byte							
DEFAULT	0	0	0	0	0	0	0	0

BIT	DESCRIPTION
7-0	This byte is defined as the high byte of the limited count in the IR RX mode.

14.1.1.8. IR RX Sample Limited Count Low Byte Register (RCLCL) – Base Address + 7

Attribute: Read/Write
Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	Sample Limited Count low Byte							
DEFAULT	0	0	0	0	0	0	0	0

BIT	DESCRIPTION
7-0	This byte is defined as the low byte of the limited count in the IR RX mode.

Note. (RCLCH, RCLCL) is defined as 16 bits value of the limited count in the IR RX mode. When the RX date length reaches the limited count, Packet End status will appear.

14.1.1.9. IR FIFO Configuration Register (FIFOCON) – Base Address + 8

Attribute: Read/Write
Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	TXFIFOCLR	Reserved	TX Trigger Level		RXFIFOCLR	Reserved	RX Trigger Level	
DEFAULT	0	0	0	0	0	0	0	0

BIT	DESCRIPTION
7	**TX FIFO Cleared**.
6	**Reserved**.
5-4	**TX Trigger Level** **Bits** **5 4** 0 0: 31 0 1: 24 1 0: 16 1 1: 8
3	**RX FIFO Cleared**.
2	**Reserved**.
1-0	**RX Trigger Level** **Bits** **1 0** 0 0: 1 0 1: 8 1 0: 16 1 1: 24

14.1.1.10. IR Sample RX FIFO Status Register – Base Address + 9

Attribute: Read Only
Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	IR_Pending	RX_GS	RX_FTA	RX_Empty	RX_Full	TX_FTA	TX_Empty	TX_Full
DEFAULT	0	0	0	0	0	0	0	0

BIT	DESCRIPTION
7	**IR Pending** 1: No Interrupt 0: Interrupt issue
6	**Minimum Length Detect Status**. This bit will be cleared when Packet End appears.
5	**RX FIFO Trigger Level Active**.
4	**RX FIFO Empty Flag**.

BIT	DESCRIPTION
3	**RX FIFO Full Flag**.
2	**TX FIFO Trigger Level Active**.
1	**TX FIFO Empty Flag**.
0	**TX FIFO Full Flag**.

14.1.1.11. IR Sample RX FIFO Register – Base Address + A

Attribute: Read Only
Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	Voltage Level	Sample RX FIFO						

BIT	DESCRIPTION
7	**Voltage Level** 0: Low, 1: High
6-0	**RX data length** (Unit : Sample Period) Note: 1. 0x80 is Packet End. The hardware enters the Idle state after checking Rx Channel. 2. When 0x00 represents the glitch packet, it means pulses shorter than 3/4 sample period are received. 3. Pulses that are shorter than 1/4 sample periods will be ignored automatically.

14.1.1.12. TX FIFO Count– Base Address + B

Attribute: Read
Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	TX FIFO Count							
DEFAULT	0	0	0	0	0	0	0	0

1: Enable; 0: Disable

BIT	DESCRIPTION
7-0	**TX FIFO Count**

14.1.1.13. IR Sample TX FIFO Register – Base Address + C

Attribute: Read Only
Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	Voltage Level	Sample TX FIFO						

BIT	DESCRIPTION
7	**Voltage Level** 0: Low, 1: High
6-0	**TX data length** (Unit : Sample Period)

14.1.1.14. IR Carrier Count High Byte Register – Base Address + D

Attribute: Read Only

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	Carrier Count High Byte							

BIT	DESCRIPTION
7-0	**Carrier Count High Byte**. This byte records the total amount of the total rising edges until time-out event appears.

14.1.1.15. IR Carrier Count Low Byte Register – Base Address + E

Attribute: Read Only

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	Carrier Count Low Byte							

BIT	DESCRIPTION
7-0	**Carrier Count Low Byte**. This byte records the total amount of the the rising edges until time-out event appears.

After a time-out of reception on the learning receiver, this response is sent to tell the host the carrier frequency of the previous sample. The Carrier Count High Byte (ch) and Carrier Count Low Byte (cl) specify the cycle counts of cycles of the carrier. Carrier counts can also be thought ofregarded as the number of leading edges in the previous sample.

This is used toe calculation of the calculate carrier frequency is as followsfollowed:

$lastCarrierCount_{(decimal)}$ = ch*256+cl;

Thus,

Carrier frequency = (lastCarrierCount) / (irPacketOnDuration);

The **irPacketOnDuration** value is the total amount of time that the envelope of the signal was is high. The IR receiver should keep track of the time that of the high envelope is high and return it using this response.

This response is unsolicited. It is returned by the receiver when IR arrives but is never explicitly requested.

14.1.1.16. IR FSM Status Register (IRFSM) – Base Address + F

Attribute: Read Only

Size: 8 bits

BIT	7	6	5	4	3	2	1	0

NAME	Reserved	Decoder FSM			Reserved	Encoder FSM		
DEFAULT	0	0	0	0	0	0	0	0

BIT	DESCRIPTION
7	**Reserved.**
6	**Decoder over status**
5	**Decoder continuing status**
4	**Decoder wait H status** 1: idle, 0: RX busy
3	**Reserved**.
2	**Encoder Idle Status**. 1: idle, 0: TX busy
1	**Encoder Read Status**
0	**Encoder Level Output Status**

14.1.1.17. IR Minimum Length Register – Base Address + F

Attribute: Write Only
Size: 8 bits

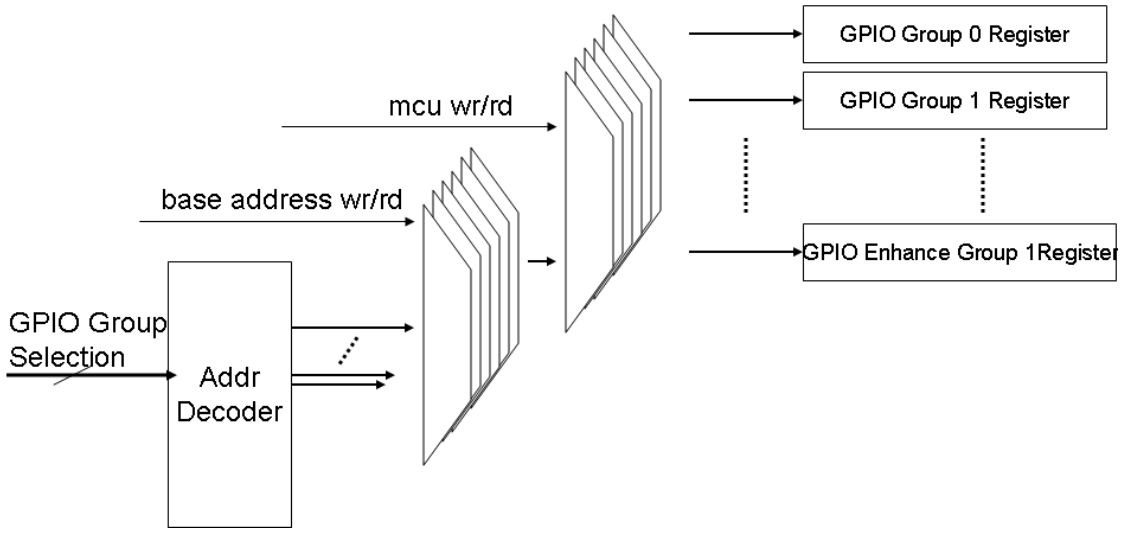
BIT	7	6	5	4	3	2	1	0
NAME	Min Length Register							
DEFAULT	0	0	0	0	0	0	0	0

BIT	DESCRIPTION
7-0	**Min Length Register**. Set up the shortest expected length of each carrier on the RX receiver (Unit: Sample Clock).

15. GENERAL PURPOSE I/O

NOTICE : Some GPIO pin functions were configured when related SW functions of EC Space were enabled. For such situations BIOS or application programs should not alter these setting to avoid abnormal function of underlying firmware. Please refer to EC Space Specification before going to change any configuration setting of GPIO pins.

GPIO Register can be programmed by LPC or 8051. LPC write to the register has two ways: through Logic Device 7, CRE0 ~ CRF0. Another way is through base address write.



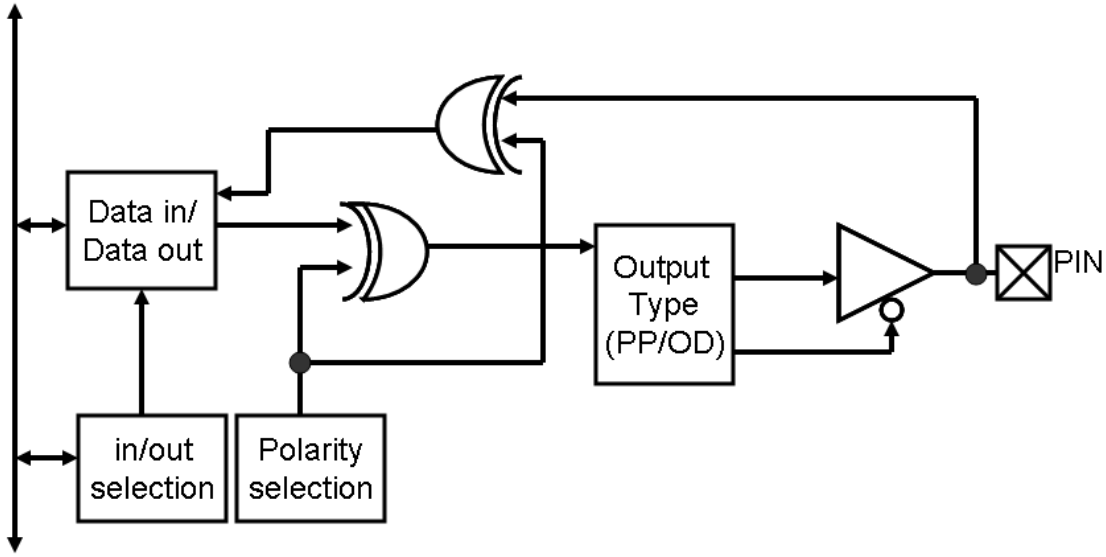
For mcu write to GPIO register, the address bit 7 ~ bit4 represent GPIO Group Selection, and bit3 ~ bit0 represent different GPIO control register or run time register.

acpi_gpio_mcu_cs & (acpi_gpio_mcu_addr[7:0] = 8'h0x) : Select GPIO_GROUP0

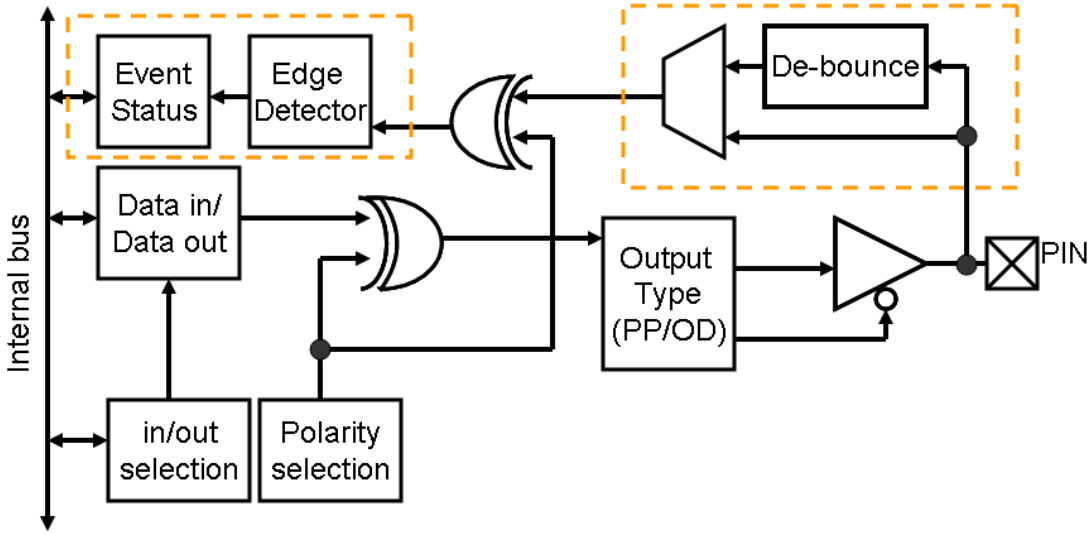
acpi_gpio_mcu_cs & (acpi_gpio_mcu_addr[7:0] = 8'h1x) : Select GPIO_GROUP1

15.1 GPIO Block Diagram

GPIO0 ~ GPIO9 Groups block diagram:

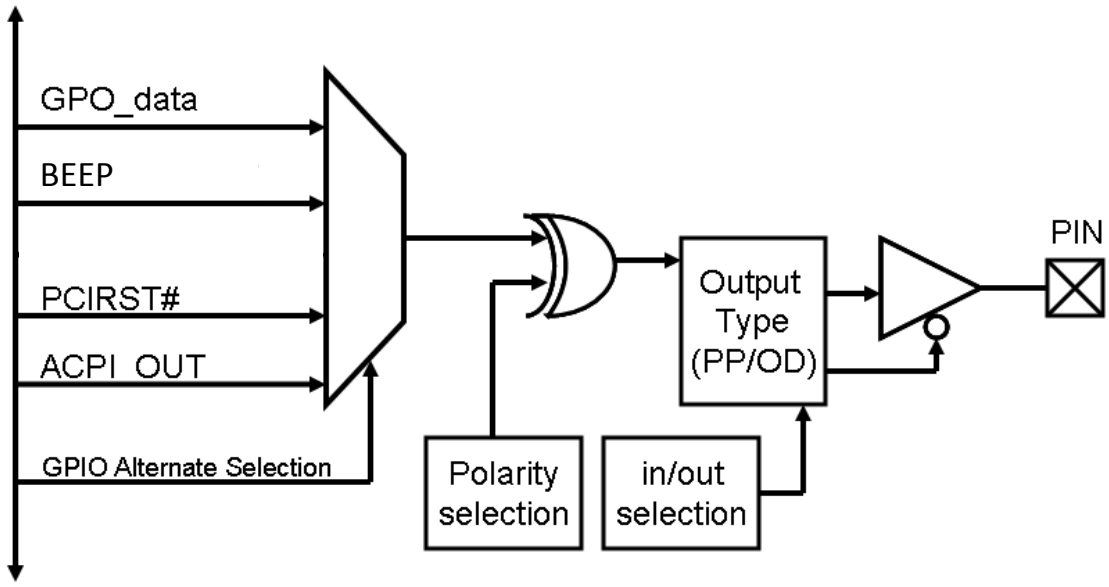


GPIOEN0 & GPIOEN1 Group block diagram:



GPIO Alternate Function block diagram:

The GPIO output can switch to BEEP function, PCIRST_OUT buffer function, and ACPI OUT function when GPO functions active. The Polarity and output type selections will also affect the output behavior.



NOTICE: When GPIO was configured to output data, please notice when GPIO data registers were read, it is the realistic pin DC status instead of wanted output state reflected by these registers. That means if external loading is heavy, the data read might not be the same as state wanted.

15.2 GPIO Runtime Register

The base address of the Address Port and Data Port is specified in registers CR[60h] and CR[61h] of Logical Device 7, the GPIO device. CR[60h] is the high byte, and CR[61h] is the low byte.

16. ON-CHIP DEBUG SUPPORT INTERFACE (ODCS)

16.1 Overview

The OCDS function allows user to read/write memory and stop/run/step MCU core unit. Most of the registers are accessible according to the way described in the NEXUS 5001 standard. All registers are accessible through the IEEE1149.1 port independently of the state of the MCU.

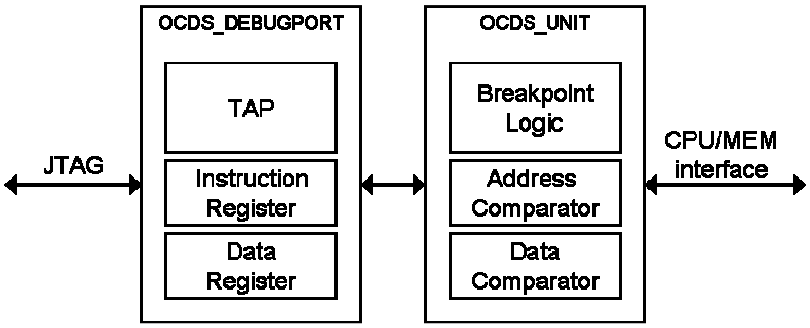

Figure 15-1 JTAG I/O Shifter Register

16.2 Function Description

16.2.1 JTAG Interface

NCT6683D-LU has 4 IEEE1149.1 required pin.

- Test Clock Input (MCU_TCK) provides clock for JTAG port.
- Test Data Input (MCU_TDI) provides for serial movement of data into JTAG port. It is sampled by NCT6683D-LU on the rising edge of MCU_TCK.
- Test Data Output (MCU_TDO) provides for serial movement of data out of JTAG port. It is driven by NCT6683D-LU on the falling edge of MCU_TCK.
- Test Mode Select Input (MCU_TMS) provides access to the JTAG TAP state machine. It is sampled by NCT6683D-LU on the rising edge of MCU_TCK.

The IEEE149.1 TRST function pin is connected to internal VSB power-on reset. After power-on reset, it has to insert 2 dummy clocks to MCU_TCK pin to release reset condition. It is recommend that forces MCU_TMS high and inserts 7 clocks to MCU_TCK to insure TAP state keeping in TEST_LOGIC_RESET state.

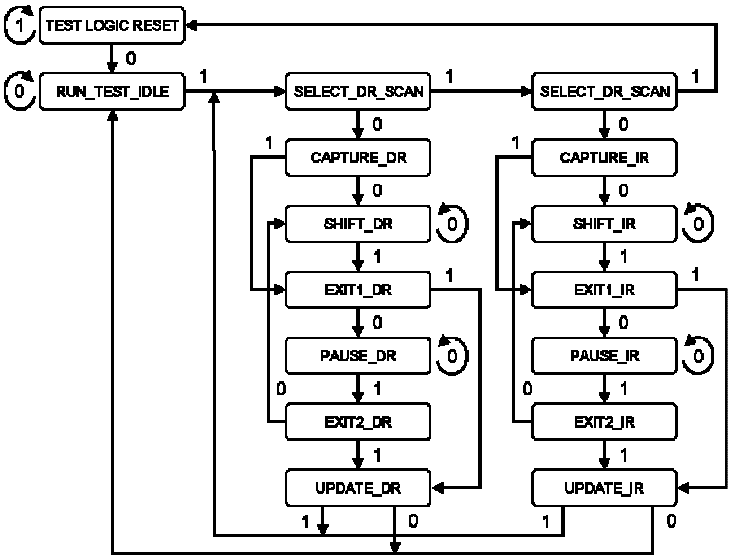

Figure 15-2 JTAG TAP State Machine

JTAG port can read/write register when TAP is in SHIFT_DR/SHIFT_IR state. MCU_TDI and MCU_TDO shifts in/out LSB bit first when data read/write.

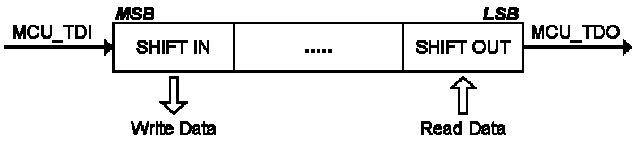

Figure 15-3 JTAG Port Shift Register

Instruction Code	Function Name	Data Register	Type
0001	IDCODE	32-bit ID value = 1050_5538h	RO
1010	OCDSMEMACC	Memory data read/write access	R/W
1011	NEXUS-ENABLE	NRR registers	per register
others	BYPASS	BYPASS register	R/W

NCT6683D-LU JTAG function supports 4 instructions as followed.

16.2.2 NRR access

When the “NEXUS-ENABLE” instruction is being decoded by the JTAG controller, the JTAG allows communications to NRRs. Each NRR is referenced by a unique register address index. All communication with the Nexus controller is performed via the SELECT_DR_SCAN path. The Nexus controller will default to a register select state when enabled. Accessing an NRR requires two passes through the SELECT-DR_SCAN path, one pass to select the NRR and the second pass to read or write the NRR data. The first pass through the SELECT-DR_SCAN path is used to enter an 8-bit Nexus command consisting of a read/write control bit in the LSB followed by a 7-bit NRR address, as illustrated in Figure15-4. When a NRR is read, the register value is loaded into JTAG shifter register during CAPTURE_DR state. When a NRR is written, the value is loaded from JTAG shifter register during UPDATE_DR state.

BIT 7-1	BIT 0
7-bit NRR address	0 = Write 1 = Read

Figure 15-4 Nexus Command Field

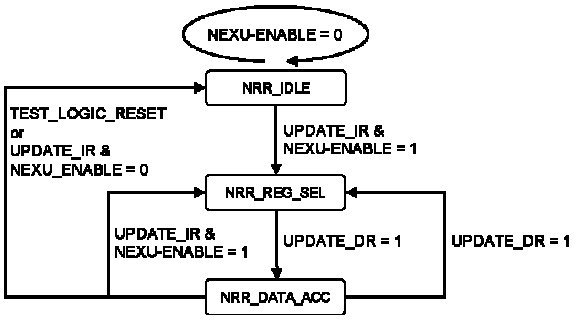

Figure 15-5 NEXU Controller State Machine

16.2.3 NRR Description

There are 45 NRRs in NCT6683D-LU. It supports five major functions to monitor/debug program.

- Monitor accumulator/program counter value.
- Execute single instruction from user/debug program.
- Read/Write external program/data memory.
- Software breakpoint. Code : 0xA5
- Hardware breakpoint

NCT6683D-LU supports 8 hardware breakpoints. Each hardware breakpoint function has 5 NRRs to monitor internal memory, external data memory and program memory operation.

16.2.3.1. OCDSCTL Register – NRR Address = 40h

Attribute: Read/Write
Power Well: VSB
Reset by: RSMRST#
Default : 00h
Size: 11 bits

BIT	READ / WRITE	DESCRIPTION
10	RO	Software breakpoint status = 0 software breakpoint didn't occur. = 1 software breakpoint occurred.
9	RO	Reserved.
8	R / W	Debugger program selector 1
7	RO	Reserved.
6	R / W	Peripheral clock enable = 1 Disable all module clock but MCU (it will cause system crash) = 0 normal operation

BIT	READ / WRITE	DESCRIPTION
5	R / W	MCU reset.
4	R / W	OCDS enable. = 1 OCDS enable. = 0 OCDS disable. The MCU will not stop at breakpoint. 0xA5 instruction is executed like NOP. MCU reset is ignored.
3	RO	Debug acknowledge = 1 The MCU is stopped at the breakpoint or debug request. = 0 The MCU is executing instruction.
2	R / W	Debug request It causes MCU enter debug mode when debug acknowledge active.
1	R / W	Debug step It causes MCU to execute single instruction when it set to 1. This bit is automatically cleared by hardware after instruction executed. This bit has to be set after debug request. Debug step and debug request can't be set simultaneously.
0	R / W	Debugger program selector 0 select1 select0 = 00 User program. PC is normally incremented. = x1 OCDSINSTR program. PC is not incremented. = 10 OCDSINSTR program. PC is normally incremented. Branch instruction will update PC normally.

16.2.3.2. OCDSACC Register – NRR Address = 41h

Attribute: Read Only
Power Well: VSB
Reset by: RSMRST#

CR E0h. GPIO Data Register
Location: Address E0h
Attribute: Read/Write
Power Well: VSB
Reset by: Varies per bit
Default : 00h
Size: 8 bits

BIT	READ / WRITE	DESCRIPTION
7-0	R / W	GPIO Data Register. This register reflects, for both read and write, the register current selected by the GPSEL register. For output ports, the respective bits can be read/ written and produced to pins. The reading data is reflecting to pin status. (Only GPIOA Group is reflecting to data registers.) For input ports, the respective bits can be read only from pins. Write accesses will be ignored. (Please see note1.)

CR E1h. Interrupt Enable Register
Location: Address E1h
Attribute: Read/Write
Power Well: VSB
Reset by: Varies per bit
Default : 00h
Size: 8 bits

BIT	READ / WRITE	DESCRIPTION
7-0	R / W	GPIO Data Register. This register reflects, for both read and write, the register current selected by the GPSEL register. 0: Disable 1: Enable (Please see note1.)

CR E2h. GPIO Status Register

Location: Address E2h
Attribute: Read/Write
Power Well: VSB
Reset by: Varies per bit
Default : 00h
Size: 8 bits

BIT	READ / WRITE	DESCRIPTION
7-0	R / W1C	GPIO Status Register. This register reflects, for both read and write, the register current selected by the GPSEL register. (Please see note1.)

CR E3h. GPIO I/O Control Register

Location: Address E3h
Attribute: Read/Write
Power Well: VSB
Reset by: Varies per bit
Default : FFh (Only GPIO Enhance Group1 default vaule is F0h)
Size: 8 bits

BIT	READ / WRITE	DESCRIPTION
7-0	R / W	GPIO Output Enable Register. This register reflects, for both read and write, the register current selected by the GPSEL register. 0: Output mode 1: Input mode (Please see note1.)

CR E4h. GPIO Inversion Control Register

Location: Address E4h
Attribute: Read/Write
Power Well: VSB
Reset by: Varies per bit
Default : 00h
Size: 8 bits

BIT	READ / WRITE	DESCRIPTION

BIT	READ / WRITE	DESCRIPTION
7-0	R / W	GPIO Inversion Control Register. This register reflects, for both read and write, the register current selected by the GPSEL register. 0: No inversion. 1: Inversion input/output. (Please see note1.)

CR E5h. GPIO PP/OD Control Register

Location: Address E5h
Attribute: Read/Write
Power Well: VSB
Reset by: Varies per bit
Default : 00h
Size: 8 bits

BIT	READ / WRITE	DESCRIPTION
7-0	R / W	GPIO Output Type Register. This register reflects, for both read and write, the register current selected by the GPSEL register. 0: Open-Drain 1: Push-Pull (Please see note1.)

CR E6h. GPIO Interrupt Type Control Register

Location: Address E6h
Attribute: Read/Write
Power Well: VSB
Reset by: Varies per bit
Default : 03h
Size: 8 bits

BIT	READ / WRITE	DESCRIPTION
7-2		Reserved.
1-0	R / W	GPIO Interrupt Type0 Control Register. This register reflects, for both read and write, the register current selected by the GPSEL register. 00h: Status field is trigger by falling edge. 01h: Status field is trigger by rising edge. 10h: Status field is trigger by both edge. 11h: Any trigger (Please see note1.)

CR E7h. GPIO Output Data Reflection Register

Location: Address E7h
Attribute: Read/Write
Power Well: VSB
Reset by: Varies per bit
Default : 00h

Size: 8 bits

BIT	READ / WRITE	DESCRIPTION
7-0	R	GPIO Output Data Reflection Register. This register reflects, the register current selected by the (GPSEL+8'h0) register.

CR E8h. GPIO Interrupt pull down Control Register (Only GP2 are valid)

Location: Address E8h
Attribute: Read/Write
Power Well: VSB
Reset by: Varies per bit
Default : FFh
Size: 8 bits

BIT	READ / WRITE	DESCRIPTION
7-0	R / W	GPIO Interrupt pull down Control Register. This register reflects, for both read and write, the register current selected by the GPSEL register. 0: Disable internal pull down 1: Enable internal pull down GP2 ➔ internal pull down

CR E9h. GPIO Reset Source Type Control Register

Location: Address E9h
Attribute: Read/Write
Power Well: VSB
Reset by: RSMRST#
Default : 03h
Size: 8 bits

BIT	READ / WRITE	DESCRIPTION
7-2	R / W	Reserved.
1-0	R / W	GPIO Reset Source Type Control Register. This register reflects, for both read and write, the register current selected by the GPSEL register. 00 : PCI RST# 01 : PWROK 10 : MCU Reset (Software Reset) 11 : RSMRST# (Please see note1.)

CR EBh. GPIO De-Bounce Clock Option Register

Location: Address EBh
Attribute: Read/Write
Power Well: VSB
Reset by: RSMRST#
Default : 00h
Size: 8 bits

BIT	READ / WRITE	DESCRIPTION

BIT	READ / WRITE	DESCRIPTION
7-0	R / W	GPIO De-Bounce Clock Option. This register reflects, for both read and write, the register current selected by the GPSEL register. (Only for GPIO Enhance Group) 0: De-bounce clock is 1MHz. 0: De-bounce clock is 1KHz. PS. The CREB[7:0] correspond to GPIOENX port [0:7].

CR ECh. GPIO De-Bounce Type 0 Register

Location: Address ECh
Attribute: Read/Write
Power Well: VSB
Reset by: Varies per bit
Default : 00h
Size: 8 bits

BIT	READ / WRITE	DESCRIPTION
7-0	R / W	GPIO De-Bounce Type 0 Register. This register reflects, for both read and write, the register current selected by the GPSEL register. (Only for GPIO Enhance Group)

CR EDh. GPIO De-Bounce Type 1 Register

Location: Address EDh
Attribute: Read/Write
Power Well: VSB
Reset by: Varies per bit
Default : 00h
Size: 8 bits

BIT	READ / WRITE	DESCRIPTION
7-0	R / W	GPIO De-Bounce Type 1 Register. This register reflects, for both read and write, the register current selected by the GPSEL register. { De-Bounce Type 0, De-Bounce Type 1} 00: No De-bounce. 01: De-bounce high. (form low to high) 10: De-bounce low. (form high to low) 11: De-bounce high and low. (Only for GPIO Enhance Group)

CR EEh. GPIO De-Bounce Time Control 0 Register

Location: Address EEh
Attribute: Read/Write
Power Well: VSB
Reset by: Varies per bit
Default : 00h
Size: 8 bits

BIT	READ / WRITE	DESCRIPTION
7-0	R / W	GPIO De-Bounce Time Control 0 Register. This register reflects, for both read and write, the register current selected by the GPSEL register. (Only for GPIO Enhance Group)

CR EFh. GPIO De-Bounce Time Control 1 Register

Location: Address EFh
Attribute: Read/Write
Power Well: VSB
Reset by: Varies per bit
Default : 00h
Size: 8 bits

BIT	READ / WRITE	DESCRIPTION
7-0	R / W	GPIO De-Bounce Time Control 1 Register. This register reflects, for both read and write, the register current selected by the GPSEL register. { De-Bounce Time Control 0, De-Bounce Time Control 1} 00: De-Bounce 4 ms 01: De-Bounce 16 ms 10: De-Bounce 32 ms 11: De-Bounce 64 ms (Only for GPIO Enhance Group)

CR F0h. GPIO Group Selection Register

Location: Address F0h
Attribute: Read/Write
Power Well: VSB
Reset by: RSMRST#
Default : 00h
Size: 8 bits

BIT	READ / WRITE	DESCRIPTION
7-4	Reserved.	
3-0	R / W	GPIO Group Selection. 4'h0: GPIO Group0 4'h1: GPIO Group1 … 4'hC: GPIO Enhance Group 1

CR F1h. GPIO Software Reset Register

Location: Address F0h
Attribute: Read/Write
Power Well: VSB
Reset by: RSMRST#

1	R / W	0: Disable PME interrupt of the GPIO IRQ event 1: Enable PME interrupt of the GPIO IRQ event
0	R / W	0: Disable PME interrupt of the WDTO IRQ event 1: Enable PME interrupt of the WDTO IRQ event

17.11 Logical Device B (EC Space)

CR 30h.

Attribute: Read/Write
Power Well: VSB
Reset by: LRESET#
Default : 00h

BIT	READ / WRITE	DESCRIPTION
7-1	Reserved	
0	R / W	0: EC Space interface is inactive. 1: EC Space interface is active.

CR 60h, 61h.

Attribute: Read/Write
Power Well: VSB
Reset by: LRESET#
Default : 00h, 00h

BIT	READ / WRITE	DESCRIPTION
7-0	R / W	These two registers select the EC Space interface base address <100h : FF8h> aligned to an eight-byte boundary.

CR 70h.

Attribute: Read/Write
Power Well: VSB
Reset by: LRESET#
Default : 00h

BIT	READ / WRITE	DESCRIPTION
7-4	Reserved	
3-0	R / W	These bits select the IRQ resource for EC Space.(MCU to Host Interrupt)

CR E0h.

Attribute: Read/Write
Power Well: VSB
Reset by: RSMRST#
Default : 00h

BIT	READ / WRITE	DESCRIPTION
7	Reserved	
6	R / W	Beep Function Enable 0: Disable 1: Enable
5-4	Reserved	

BIT	READ / WRITE	DESCRIPTION
3	R / W	Disconnect 8042 KBC from 4 PS2 pins (DISCON_KBCPINS) 0: The 4 PS2 pins were connected to KBC when VCC arrived 1: The 4 PS2 pins kept NOT tied to KBC when VCC arrived Notes : 1. With this bit cleared (as 0), when function of the 4 PS2 pins was switched to functions other than PS2 by external debug daughter board, they won't be tied to KBC any more when VCC arrives. 2. With this bit cleared (as 0), once KBC took over the 4 PS2 pins after VCC arrives, the only way to break this connection before exiting S0 state is to set this bit as 1, by LPC or MCU FW. External debug daughter board cannot help under this situation.
2-0	Reserved	

CR E3h.
Attribute: Read/Write
Power Well: VSB
Reset by: RSMRST#
Default : 00h

BIT	READ / WRITE	DESCRIPTION
7	R / W	Switch Reg Enable 1 When SBI_CFG_EN = 0 0: the connection of switch 1 is controlled by ATXPGD (ATXPGD is low, switch 1 is dis-connected. ATXPGD is high, switch 1 is connected) 1: the connection of switch 1 is controlled by Switch Control 1 When SBI_CFG_EN = 1 0: the connection of switch 1 is controlled by Switch Control 1 1: the connection of switch 1 is controlled by ATXPGD (ATXPGD is low, switch 1 is dis-connected. ATXPGD is high, switch 1 is connected)
6	R / W	Switch Control 1 0: switch 1 is always dis-connected. 1: switch 1 is alywas connected.

BIT	READ / WRITE	DESCRIPTION
5	R / W	Switch Reg Enable 2 When SBI_CFG_EN = 0 0: the connection of switch 2 is controlled by ATXPGD (ATXPGD is low, switch 2 is dis-connected. ATXPGD is high, switch 2 is connected) 1: the connection of switch 2 is controlled by Switch Control 2 When SBI_CFG_EN = 1 0: the connection of switch 2 is controlled by Switch Control 2 1: the connection of switch 2 is controlled by ATXPGD (ATXPGD is low, switch 2 is dis-connected. ATXPGD is high, switch 2 is connected)
4	R / W	Switch Control 2 0: switch 2 is always dis-connected. 1: switch 2 is alywas connected.
3	R / W	Switch Reg Enable 3 When SBI_CFG_EN = 0 0: the connection of switch 3 is controlled by ATXPGD (ATXPGD is low, switch 3 is dis-connected. ATXPGD is high, switch 3 is connected) 1: the connection of switch 3 is controlled by Switch Control 3 When SBI_CFG_EN = 1 0: the connection of switch 3 is controlled by Switch Control 3 1: the connection of switch 3 is controlled by ATXPGD (ATXPGD is low, switch 3 is dis-connected. ATXPGD is high, switch 3 is connected)
2	R / W	Switch Control 3 0: switch 3 is always dis-connected. 1: switch 3 is alywas connected.
1-0	Reserved	

17.12 Logical Device C (RTC Timer)

CR 30h. RTC Timer configuration register

Attribute: Read/Write
Power Well: VRTC
Reset by: Battery reset
Default : 00h

BIT	READ / WRITE	DESCRIPTION
7-6	Reserved	
5	R / W	Issue wakeup event to PME 0: Disable 1: Enable
4	R / W	Issue wakeup event to PSOUT 0: Disable 1: Enable

BIT	READ / WRITE	DESCRIPTION
7	R / W	0: Enable Alarm of hour 1: Disabe Alarm of hour
6	Reserved	
5-0	R / W	Alarm of hour (00 ~ 23 or 01 ~ 12)

CR E9h. Alarm of minute
Attribute: Read/Write

Power Well: VRTC
Reset by: Battery reset
Default : 00h

BIT	READ / WRITE	DESCRIPTION
7	R / W	0: Enable Alarm of minute 1: Disabe Alarm of minute
6-0	R / W	Alarm of minute (00 ~ 59)

CR EAh. Interrupt Enable Bits
Attribute: Read/Write
Power Well: VRTC
Reset by: Battery reset
Default : 00h

BIT	READ / WRITE	DESCRIPTION
7-1	Reserved	
0	R / W	Interrupt enable of time alarm. 0: Disable 1: Enable

CR EBh. Interrupt flags
Attribute: Read/Write
Power Well: VRTC
Reset by: Battery reset
Default : 00h

BIT	READ / WRITE	DESCRIPTION
7-1	Reserved	
0	R / W	The flag of time alarm. This bit can be cleared to 0 by writing 1 to it.

17.13 Logical Device D (Deep Sleep, Power Fault)

CR 30h. Deep Sleep configuration register

Attribute: Read/Write
Power Well: VRTC
Reset by: Battery reset
Default : 20h

BIT	READ / WRITE	DESCRIPTION
7	R / W	DIS_SLPSUS_PULLUP (test mode) 0: Enable SLP_SUS# internal pull-up. 1: Disable SLP_SUS# internal pull-up.
6	R / W	RSMRST# Detect Source Select for Deep Sleep Mode. 0: RSMRST# detected source from PSOUT# voltage. 1: RSMRST# detected source from PCHVSB voltage. **Note**. Set to 0, if Deep S5 is enabled. Set to 1, if DSW is enabled.
5	R / W	Deep_s3_opt 0: When enter Deep S3 state, the SUS_WARN_5VDUAL will keep low. 1: When enter Deep S3 state, the SUS_WARN_5VDUAL will follow DSW sequence.
4	R / W	dsw_wake_opt (test mode) 0: The PSOUT# will assert until SLPS3# high when deep s5 wakeup event happened. 1: The PSOUT# will assert until RSMRST_L high and SLP_SUS_L high when deep s5 wakeup event happened. **PS. This bit only active when PCH_DSW_EN & (Deep S5 Enable | Deep S3 Enable)**
3	R / W	PCH DSW Enable 0: If PCH disable DSW function. 1: if PCH enable DSW function. (SLP_SUS# affects RSMRST#)
2-0	Reserved	

CR E3h. SUSACK Counter Register

Attribute: Read/Write
Power Well: VRTC
Reset by: Battery reset
Default : 6Eh

BIT	READ / WRITE	DESCRIPTION
7-0	R / W	SUSACK Counter Register. When system exit DSW State, 5VDUAL will wait a delay time to pull up. Default is 220ms. Example:Reg = 0 -> Delay = 0~1ms Reg = 1 -> Delay = 1~3ms Reg = 2 -> Delay = 3~5ms

CR E4h. Deep S5 Front Panel Green & Yellow LED control register

Attribute: Read/Write
Power Well: VRTC
Reset by: Battery reset
Default : 00h

BIT	READ / WRITE	DESCRIPTION
7	Reserved	
6-4	R / W	**Deep S5**_YLW_BLK_FREQ bits (This function affects by LDB CRE6 Bit 5) 000: High-Z. (The output type of YLW_LED is open-drain.) IN_{tsp5} – 5V TTL-level, Schmitt-trigger input pin						
Input Low Threshold Voltage	Vt-	0.5	0.8	1.1	V	VCC = 3.3 V
Input High Threshold Voltage	Vt+	1.6	2.0	2.4	V	VCC = 3.3 V
Hystersis	VTH	0.5	1.2		V	VCC = 3.3 V
Input High Leakage	ILIH			+10	µA	VIN = 3.3 V
Input Low Leakage	ILIL			-10	µA	VIN = 0 V
O_{8p3} – 3.3V Output pin with 8mA source-sink capability						
Output Low Voltage	VOL			0.4	V	IOL = 8 mA
Output High Voltage	VOH	2.4			V	IOH = -8 mA

PARAMETER	SYM	MIN	TYP	MAX.	UNIT	CONDITIONS
OD8p3 – 3.3V Open-drain output pin with 8mA sink capability						
Output Low Voltage	VOL			0.4	V	IOL = 8 mA
O8p5 – 5V Output pin with 8mA source-sink capability						
Output Low Voltage	VOL			0.4	V	IOL = 8 mA
Output High Voltage	VOH	2.4			V	IOH = -8 mA
OD8p5 – 5V Open-drain output pin with 8mA sink capability						
Output Low Voltage	VOL			0.4	V	IOL = 8 mA
O12p5 – 5V Output pin with 12mA source-sink capability						
Output Low Voltage	VOL			0.4	V	IOL = 12 mA
Output High Voltage	VOH	2.4			V	IOH = -12 mA
OD12p5 – 5V Open-drain output pin with 12mA sink capability						
Output Low Voltage	VOL			0.4	V	IOL = 12 mA
O24p5 – 5V Output pin with 24mA source-sink capability						
Output Low Voltage	VOL			0.4	V	IOL = 24 mA
Output High Voltage	VOH	2.4			V	IOH = -24 mA
OD24p5 – 5V Open-drain output pin with 24mA sink capability						
Output Low Voltage	VOL			0.4	V	IOL = 24 mA
I/O_{V3} – Bi-direction pin with source capability of 6 mA and sink capability of 1 mA for INTEL® PECI						
Input Low Voltage	V_{IL}	0.275*V_{tt}		0.5*V_{tt}	V	
Input High Voltage	V_{IH}	0.55*V_{tt}		0.725*V_{tt}	V	
Output Low Voltage	V_{OL}			0.25*V_{tt}	V	
Output High Voltage	V_{OH}	0.75*V_{tt}			V	
Hysterisis	V_{Hys}	0.1*V_{tt}			V	

19. AC CHARACTERISTICS

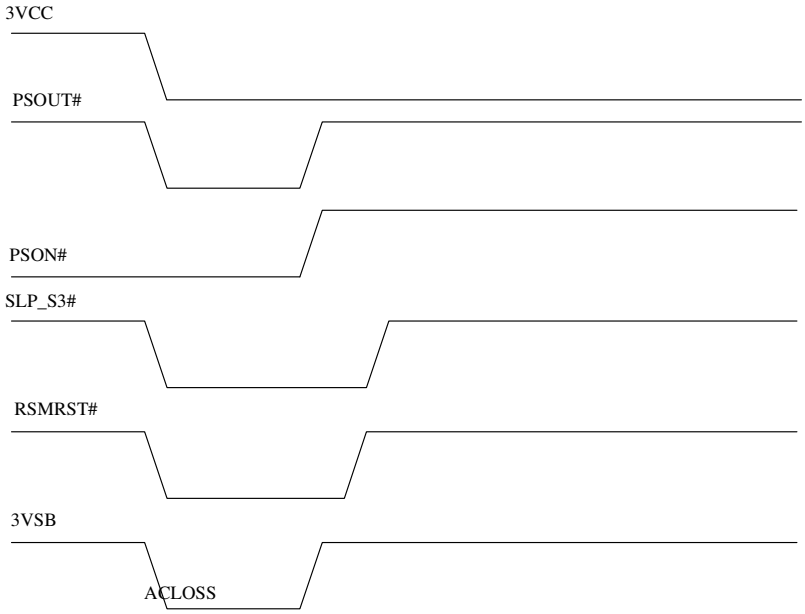
19.1 Power On / Off Timing

	T1	T2	T3	T4
IDEAL TIMING	48ms~66ms	Over 64ms at least	< 10ns	15ms~32ms

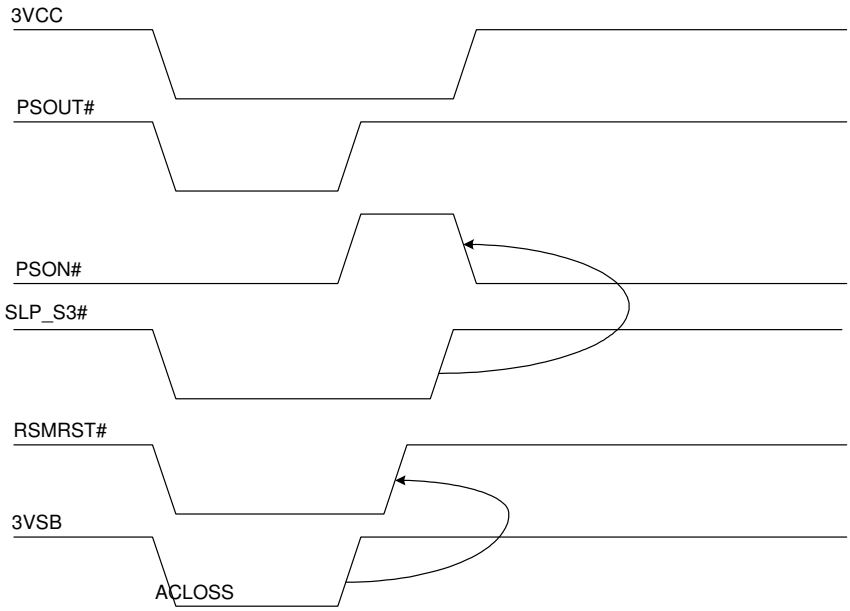
19.2 AC Power Failure Resume Timing

(1) Logical Device A, CR [EBh] bits [6:5] =00 means “OFF” state

(“OFF” means the system is always turned off after the AC power loss recovered.)



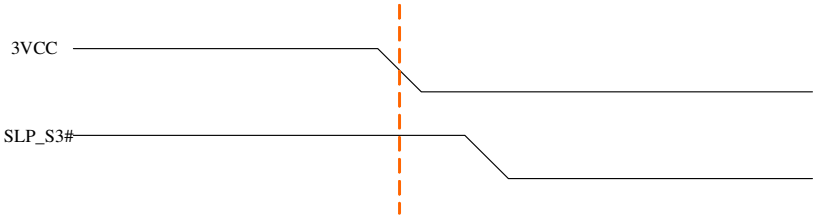
(2) Logical Device A, CR [EBh] bits [6:5]=01 means “ON” state.
(“ON” means the system is always turned on after AC power loss recovered.)



**** What's the definition of former state at AC power failure?**

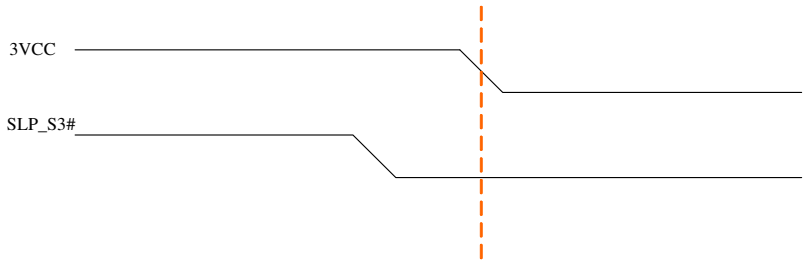
1) The previous state is "ON"

VCC falls to 2.6V and SLP_S3# keeps at VIH 2.0V



2) The previous state is "OFF"

VCC fall to 2.6V and SLP_S3# keeps at VIL 0.8V



To ensure that VCC does not fall faster than VSB in various ATX Power Supplies, the NCT6683D adds the option of "user define mode" for the pre-defined state before AC power failure. BIOS can set the pre-defined state for the system to be "On" or "Off". According to this setting, the system chooses the state after the AC power recovery.

Please refer to the descriptions of bit 6~5 of CR EBh and bit 4 of CR ECh in Logical Device A.

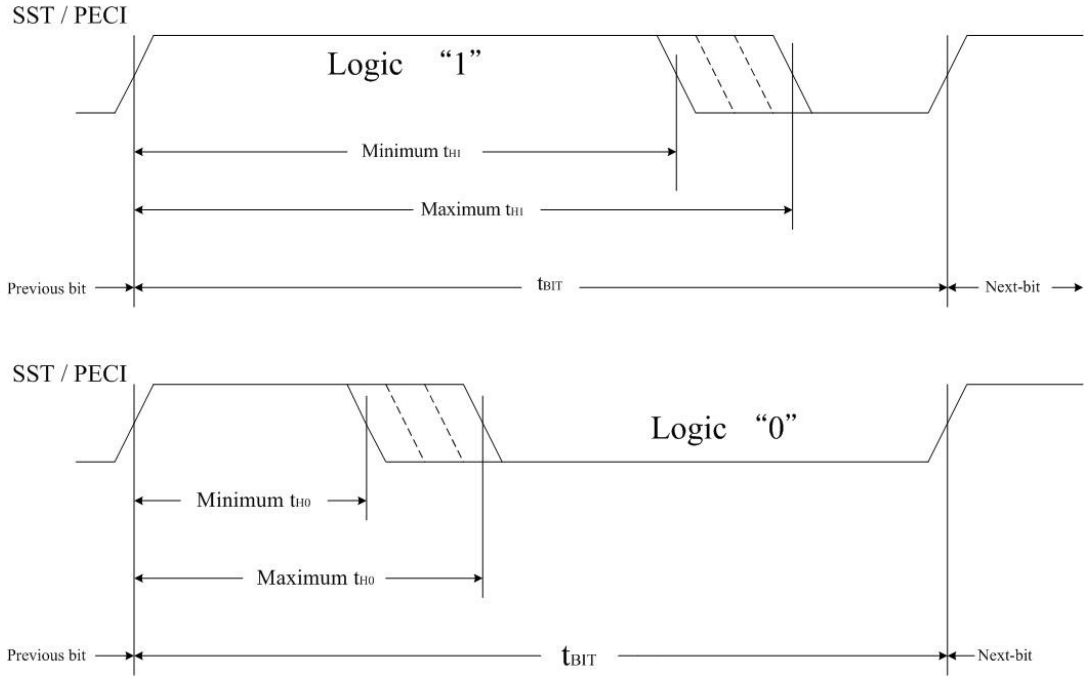
CR EBh

BIT	READ/WRITE	DESCRIPTION
6~5	R / W	Power-loss control bits => (VBAT) 0 0: System always turns off when it returns from power-loss state. 0 1: System always turns on when it returns from power-loss state. 1 0: System turns off / on when it returns from power-loss state depending on the state before the power loss. 1 1: User defines the resuming state before power loss.(refer to Logic Device A, CRE6[4])

CR ECh

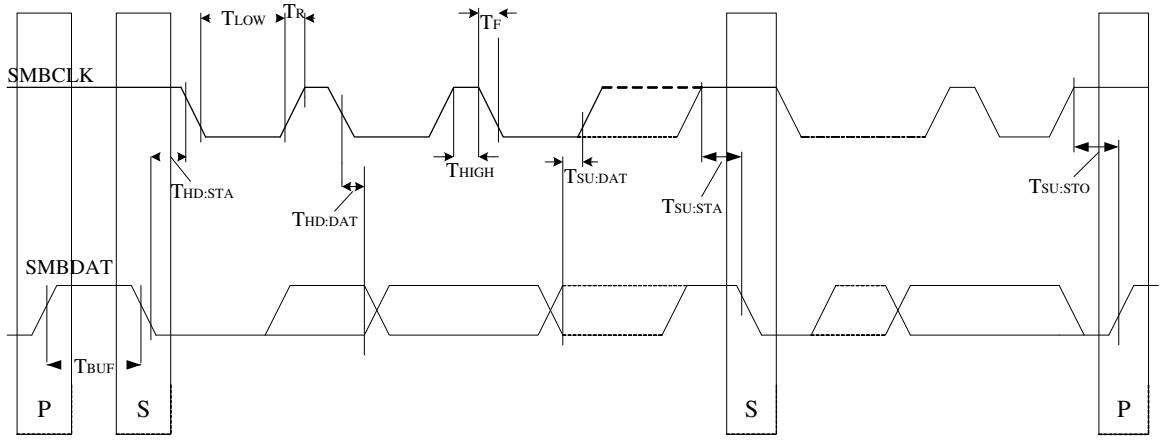
BIT	READ/WRITE	DESCRIPTION
0	R / W	Power-loss Last State Flag. 0: ON 1: OFF

19.3 PECI Timing



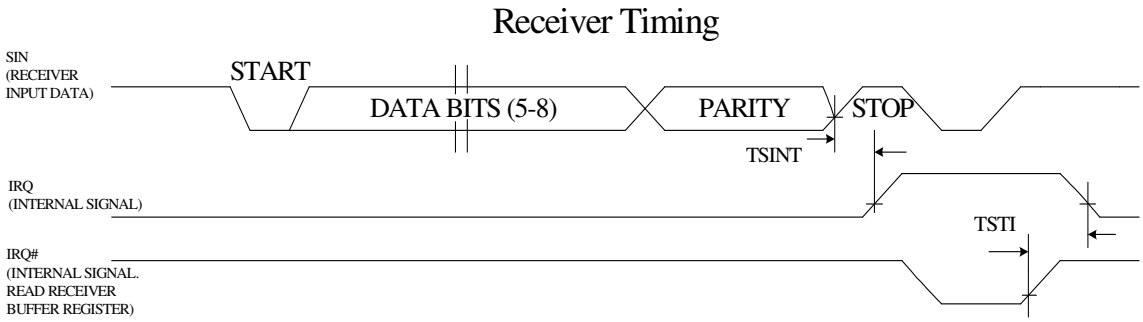
SYMBOL		MIN	TYP	MAX	UNITS
t_{BIT}	Client	0.495		500	μs
	Originator	0.495		250	
t_{H1}		0.6	3/4	0.8	× t_{BIT}
t_{H0}		0.2	1/4	0.4	× t_{BIT}

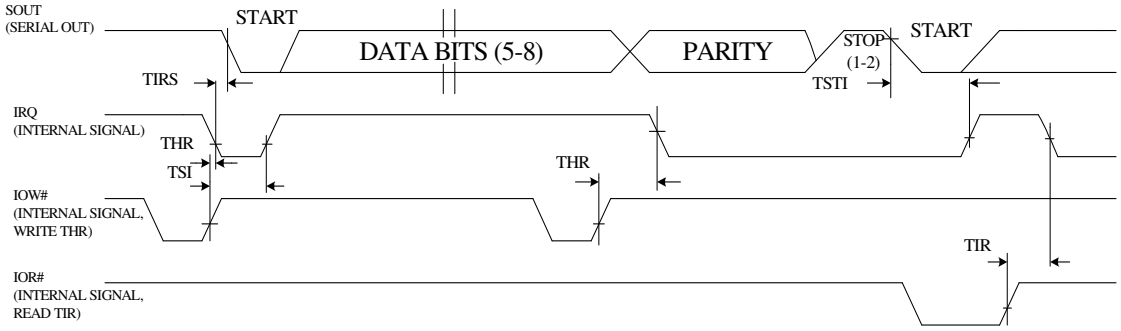
19.4 SMBus Timing



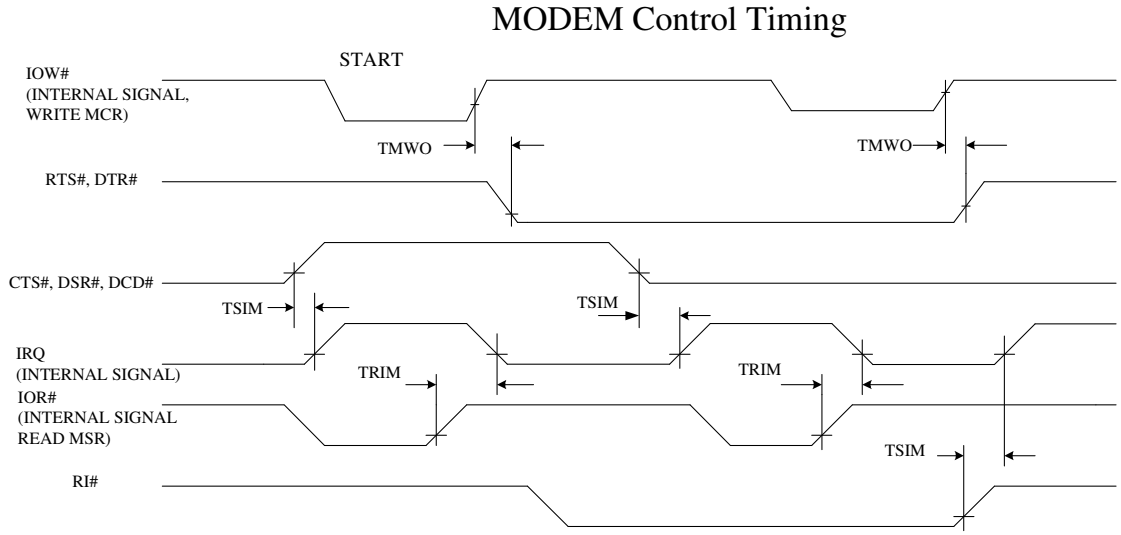
19.5 UART/Parallel Port

PARAMETER	SYMBOL	TEST CONDITIONS	MIN.	MAX.	UNIT
Delay from Stop to Set Interrupt	TSINT		9/16		Baud Rate
Delay from $\overline{IOR}$ Reset Interrupt	TRINT		9	1000	nS
Delay from Initial IRQ Reset to Transmit Start	TIRS		1/16	8/16	Baud Rate
Delay from to Reset interrupt	THR			175	nS
Delay from Initial $\overline{IOW}$ to interrupt	TSI		9/16	16/16	Baud Rate
Delay from Stop to Set Interrupt	TSTI			8/16	Baud Rate
Delay from $\overline{IOR}$ to Reset Interrupt	TIR		8	250	nS
Delay from $\overline{IOR}$ to Output	TMWO		6	200	nS
Set Interrupt Delay from Modem Input	TSIM		18	250	nS
Reset Interrupt Delay from $\overline{IOR}$	TRIM		9	250	nS
Baud Divisor	N	100 pF Loading		2^{16}-1	





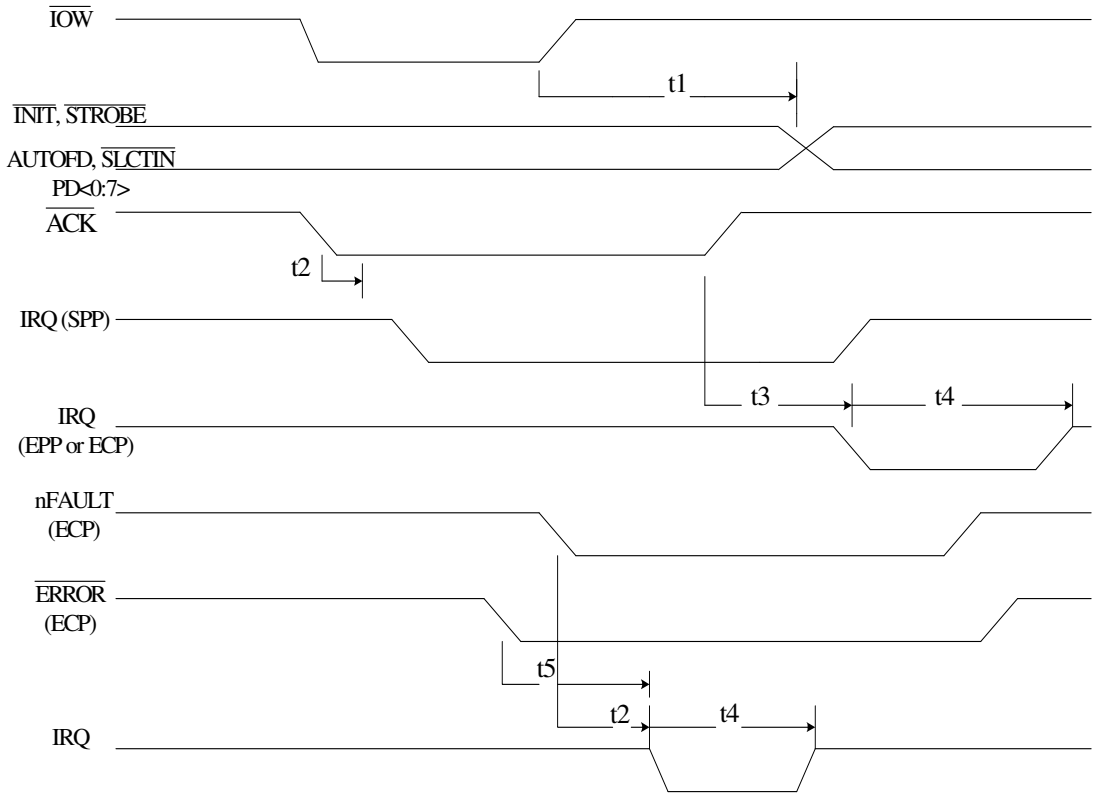
19.6 Modem Control Timing



19.7 Parallel Port Mode Parameters

PARAMETER	SYM.	MIN.	TYP.	MAX.	UNIT
PD0-7, INDEX, STROBE, AUTOFD Delay from IOW	t1			100	nS
IRQ Delay from ACK, nFAULT	t2			60	nS
IRQ Delay from IOW	t3			105	nS
IRQ Active Low in ECP and EPP Modes	t4	200		300	nS
ERROR Active to IRQ Active	t5			105	nS
PARAMETER	**SYM.**	**MIN.**	**TYP.**	**MAX.**	**UNIT**
PD0-7, INDEX, STROBE, AUTOFD Delay from IOW	t1			100	nS
IRQ Delay from ACK, nFAULT	t2			60	nS
IRQ Delay from IOW	t3			105	nS
IRQ Active Low in ECP and EPP Modes	t4	200		300	nS
ERROR Active to IRQ Active	t5			105	nS

19.7.1 Parallel Port Timing



19.7.2 EPP Data or Address Read Cycle Timing Parameters

PARAMETER	SYM.	MIN.	MAX.	UNIT

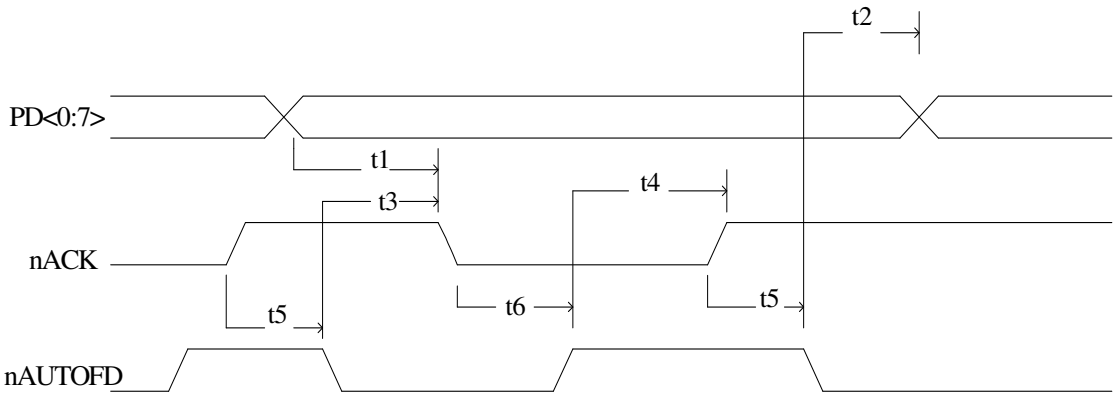
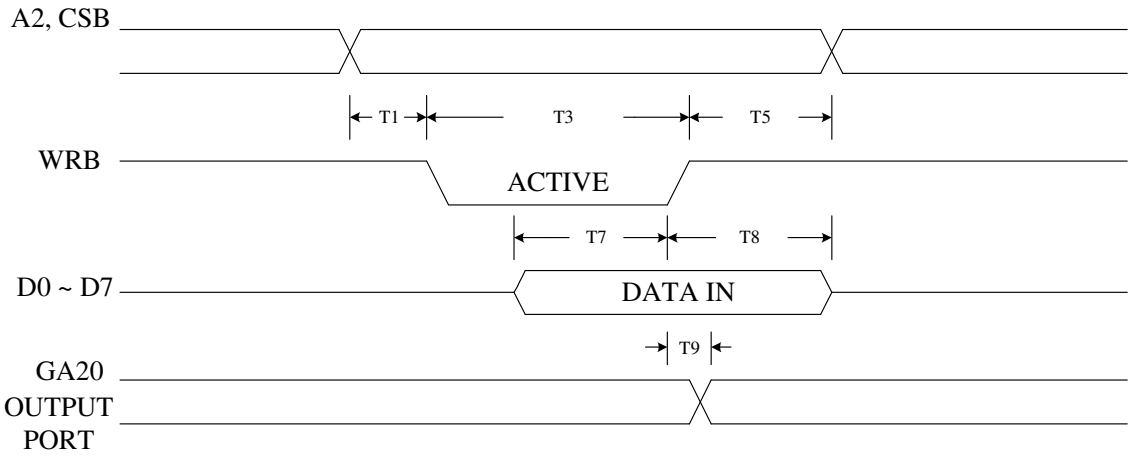
19.7.13 ECP Parallel Port Reverse Timing



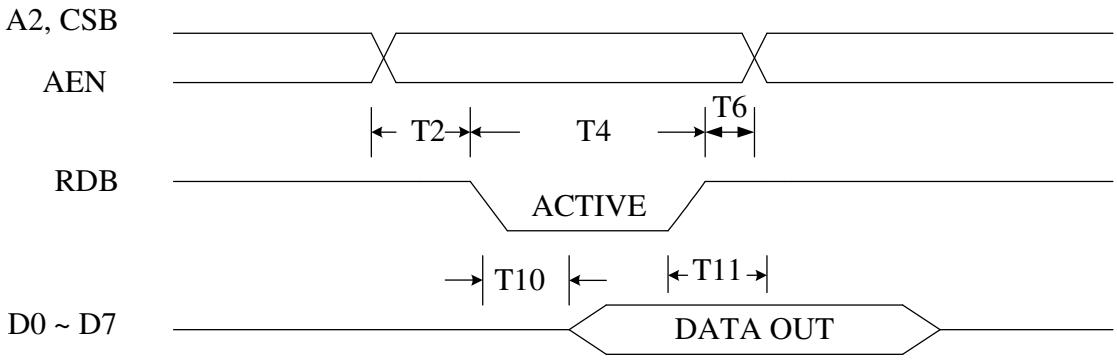
19.8 KBC Timing Parameters

NO.	DESCRIPTION	MIN.	MAX.	UNIT
T1	Address Setup Time from WRB	0		nS
T2	Address Setup Time from RDB	0		nS
T3	WRB Strobe Width	20		nS
T4	RDB Strobe Width	20		nS
T5	Address Hold Time from WRB	0		nS
T6	Address Hold Time from RDB	0		nS
T7	Data Setup Time	50		nS
T8	Data Hold Time	0		nS
T9	Gate Delay Time from WRB	10	30	nS
T10	RDB to Drive Data Delay		40	nS
T11	RDB to Floating Data Delay	0	20	nS
T12	Data Valid After Clock Falling (SEND)		4	µS
T13	K/B Clock Period	20		µS
T14	K/B Clock Pulse Width	10		µS
T15	Data Valid Before Clock Falling (RECEIVE)	4		µS
T16	K/B ACK After Finish Receiving	20		µS
T19	Transmit Timeout		2	mS
T20	Data Valid Hold Time	0		µS
T21	Input Clock Period (6–16 Mhz)	63	167	nS
T22	Duration of CLK inactive	30	50	µS
T23	Duration of CLK active	30	50	µS
T24	Time from inactive CLK transition, used to time when the auxiliary device sample DATA	5	25	µS
T25	Time of inhibit mode	100	300	µS
T26	Time from rising edge of CLK to DATA transition	5	T28-5	µS
T27	Duration of CLK inactive	30	50	µS
T28	Duration of CLK active	30	50	µS
T29	Time from DATA transition to falling edge of CLK	5	25	µS

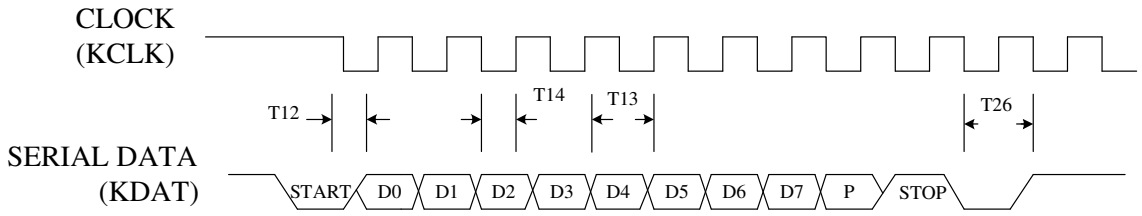
19.8.1 Writing Cycle Timing



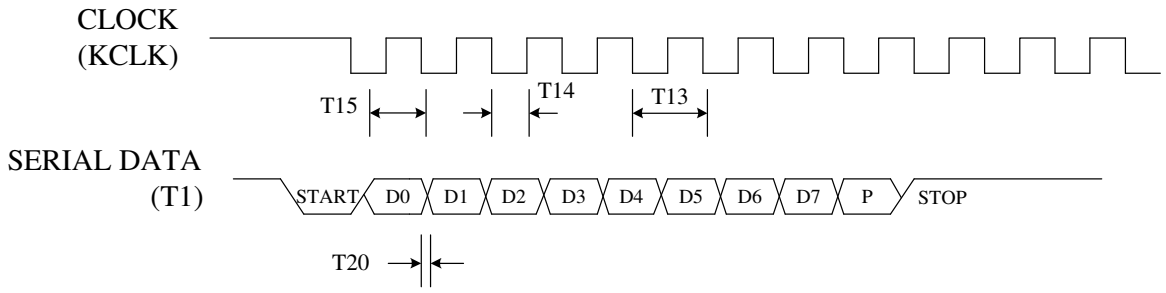
19.8.2 Read Cycle Timing



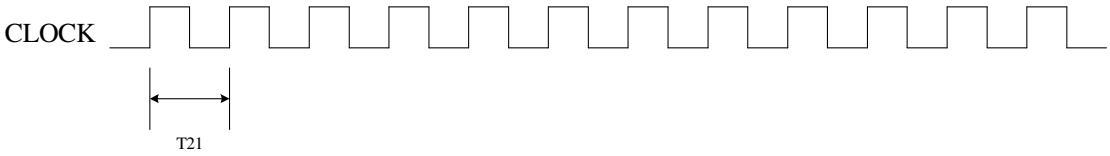
19.8.3 Send Data to K/B



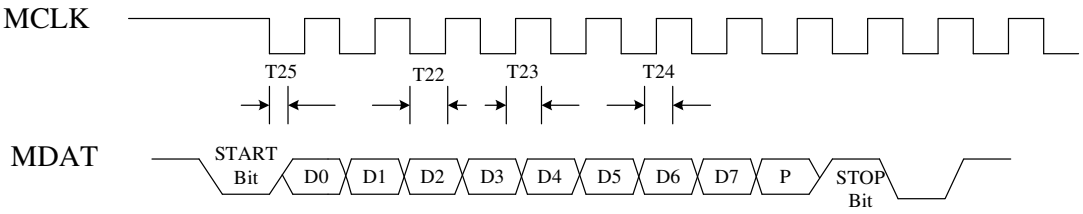
19.8.4 Receive Data from K/B



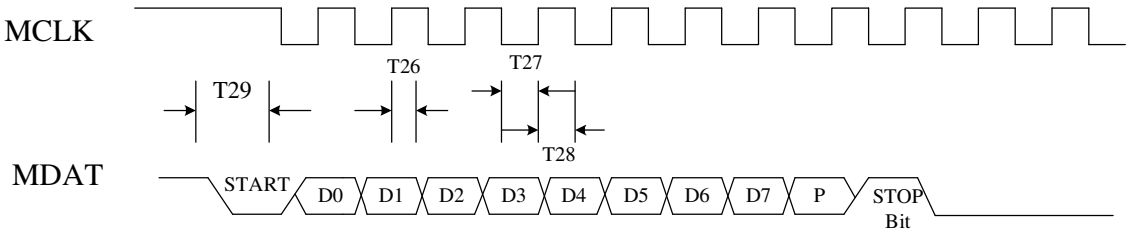
19.8.5 Input Clock



19.8.6 Send Data to Mouse



19.8.7 Receive Data from Mouse

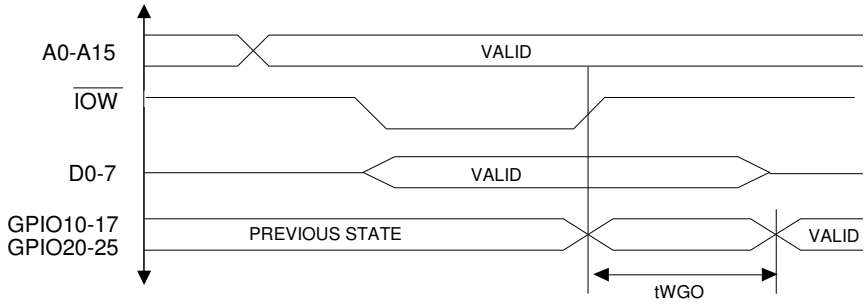


19.9 GPIO Timing Parameters

SYMBOL	PARAMETER	MIN.	MAX.	UNIT
t_{WGO}	Write data to GPIO update		300(Note 1)	ns

Note: Refer to Microprocessor Interface Timing for Read Timing

19.9.1 GPIO Write Timing



20. TOP MARKING SPECIFICATIONS

1st line: Nuvoton logo
2nd line: part number: NCT6683D-LU
3rd line: wafer production series lot number: E902B006
4th line: tracking code 010G9AFA
010: packages made in 2010, week 10
G: assembly house ID; G means GR, A means ASE, etc.
9: code version; 9 means code 009
A: IC revision; A means version A; B means version B, and C means version C
FA: Nuvoton internal use.
